Dee Hwa Liong Academy Virtual Classroom

A special problem in partial fulfillment
of the requirements for the degree of
Bachelor of Science in Computer Science

Submitted by:

Marvin Sherwin O. Tejada

June 2016

Permission is given for the following people to have access to this SP:

Available to the general public	Yes
Available only after consultation with author/SP adviser	No
Available only to those bound by confidentiality agreement	No

ACCEPTANCE SHEET

The Special Problem entitled “Dee Hwa Liong Academy Virtual Classroom” prepared and submitted by Marvin Sherwin O. Tejada in partial fulfillment of the requirements for the degree of Bachelor of Science in Computer Science has been examined and is recommended for acceptance.

Gregorio B. Baes, Ph.D. (candidate)
Adviser

Abstract

The Dee Hwa Liong Academy Virtual Classroom is an online (although also accessible offline) student and faculty learning portal. The aim of the system is to create a bridge between students and faculty whenever direct confrontation is not applicable. The system also patterns existing learning portals such as Moodle, Genyo, and Blackboard, but is customized to suit the requirements of the client, Dee Hwa Liong Academy.

Keywords: Virtual classroom, learning portals, Dee Hwa Liong Academy, examination creator

I. Introduction

A. Background of the Study

Because of the level of technology today, people are no longer limited to just physical contact in terms of communication. The internet has been successful in making its way into the lives of the public and in being an effective medium for communication. The success of numerous social networking sites attests to how effective using the internet as medium for communication can be.

One of the greatest perks of communicating online is that one does not need to be near someone to talk to another person. People can be miles apart, yet they can share information. People do not even need being online at the same time to share information. With today's technology, storing data in the cloud has become more and more convenient. Many people are utilizing this technology for their data management.

The education sector is adapting to these said advancements in technology. Online learning portals are now being developed across the whole world. Online learning is defined as courses in which at least 80 percent of the course content is delivered online [1]. Basically, online learning portals act as secondary, although virtual, classrooms to students.

Learning experience does not degrade just because the students and the teachers do not meet eye to eye. In a study done by Anna Yan Ni, she concluded that student performance is independent of the mode of instruction. In fact, quality and quantity of interaction is said to be better in online classes [2]. The main reason why online learning is effective as a substitute to traditional learning is because of increasing student access [3]. Students who may have missed

their class can keep up with the rest of the class provided that the teachers upload lesson readings that the student may use.

Dee Hwa Liong Academy is named after its founder, Mr. Cao Pek. Mr. Cao Pek founded the Deeco Electronics Manufacturing, a manufacturing company that specializes in assembly and manufacture of transformers, battery chargers, welding transformers, and public address systems, on February 2, 1948.

To date, over 80 commercial radio stations and 12 telephone exchanges are operating with equipment supplied by DEECO. Behind this wide range of broadcast and telecommunications equipment are fully established enterprises Deeco Electronics Manufacturing, and Dee Hwa Liong Electronics Equipment Corporation.

In 1983, Mr. Cao Pek “resigned” from active participation in DEECO’s affairs and devoted all his time to philanthropic work. He took over the Principalship of the 200-student Cheng Kuang School and transformed it into the 1000-student Cheng Kuang High School, with two new 3-storey building erected under his supervision.

As of now, DHLA is currently offering courses from kindergarten to high school education. Since its establishment, most of DHLA’s processes are performed manually, including but not limited to the process of students taking examinations. The school also has no online portal in use and relies solely on emails and their Facebook page for feedback. [4]

B. Statement of the Problem

Dee Hwa Liong has been doing all of their examinations manually. Since an exam is answered through handwriting, there may be some answers that are illegible to the checker. This may contribute to an error on the checker's part. It should also be noted that checking the examinations take up much time and effort. With the volume of students a faculty member in Dee Hwa Liong is teaching, checking all of the exams would take days. After the process of checking the exams, the teacher would still need to record all of the scores of the students he/she handles and this process will also take time and effort.

Another platform that Dee Hwa Liong Academy needs is an online portal. With the upcoming implementation of the K-12 program, DHLA's volume of students is expected to increase. It would be harder to keep up with the increasing amount of students. There could be difficulty in handling all the requirements being submitted by all those students.

Although there are many existing online learning portals, they all cater to the specifications submitted by their clients. DHLA's processes certainly differ from those of other educational institutions. Aside from conforming to DHLA's records, the system must also comply with the upcoming K-12 grading system.

It is because of these reasons that a new system will be created to cater to Dee Hwa Liong Academy's specifications. The said system should be able to speed up the process of taking examinations because checking of exams will be automated, and human intervention will be minimized making the examinations more reliable. The system would also create a way for teachers and students to communicate more easily and make submission of requirements easier.

C. Objectives of the Study

The aim of this study is to create a web-based learning platform that can process examinations online as well as provide a virtual classroom. This study aims to create a user-friendly interface that can provide the users ease of access while covering much of what happens in a real classroom.

The specific functionalities of this study are as follows:

1. The faculty can do the following:
 - a. Login and logout of the system
 - b. Change his/her password
 - c. View all classes he/she is handling in a given school year
 - d. Create new categories, topics, and subtopics for questions
 - e. Create questions and add it in the question bank
 - f. Create a post in a given class that will be viewable by all students in the class
 - g. Create a requirement in a given class that will be viewable by all students in the class
 - h. Create an examination by giving the parameters of the examination, including the time interval when the examination would be accessible to the students
 - i. View the submissions of the students in the class
 - j. View the results of the examinations of students in the class
 - k. Upload files that can be downloaded by his/her students
 - l. View the list of users who have downloaded an uploaded file

- m. View the class record of the students in the class
- 2. The students can do the following:
 - a. Login and logout of the system
 - b. Change his/her password
 - c. View the list of classes he/she is enrolled to
 - d. View the posts made by the faculty and the system administrator
 - e. View the requirements made by the faculty
 - f. Submit a file in response to a requirement
 - g. Answer an examination the faculty has prepared
- 3. The school management can do the following:
 - a. Login and logout of the system
 - b. Change his/her password
 - c. View site statistics
- 4. The system administrator can do the following:
 - a. Login and logout of the system
 - b. Change his/her password
 - c. Create new users of the role: faculty, student, school management
 - d. Create a new system administrator, which will lead to the current system administrator's account to be disabled.
 - e. Create new sections
 - f. Create new school year
 - g. Enlist students in a grade section
 - h. Specify what subjects a given grade section would take

- i. Assign a faculty who will be handling a subject of a particular grade section
- j. Edit other users' information or disable their account completely

D. Significance of the Study

The system would be able to produce examinations that is composed of multiple choice, fill in the blanks, true or false, and matching type (which are classified as “match column a with column b” and “select from the wordbox”) formats. Automated checking of the answers of the students would make the process of examination checking faster. The system would produce exams randomly by picking a group of questions from a given question bank. This would help in creating multiple exams, significantly lowering the chances of a student cheating. The scores of the students will also be automatically stored in the class record of the teacher. The system also uses a user-friendly interface that will help the teachers adjust easily to the new implementation of examinations.

The online portal can act as a site where all the subject related files can be stored. Just like most online learning systems, this will act as a virtual dropbox for the faculty and students. The system is also designed in such a way that user without the proper permission cannot access certain files. The portal can also act as news feed from which users can see updates posted by others.

The system would also keep track of all the downloads and uploads being made. Every time a file was either downloaded or uploaded, the system would log the date and time of that process.

The system is expected to greatly reduce the time and effort used in creating, checking, and recording exams. This will also help students in having a centralized portal to access subject related files from their different subjects.

E. Scope and Limitations

1. Although the chances are very slim, the possibility of two students getting exactly the same exam is possible.
2. The types of questions are limited to the following: multiple choice, true or false, select from the wordbox, match column a with column b, and fill in the blanks. Other types of exams are excluded from the said system.
3. The system is not responsible for any misspelled or incorrectly written questions by teachers, nor is the system responsible for any incorrect questions made by the faculty.
4. The file upload size limit is 16mb, whether the user is a faculty or a student.
5. The maximum size of images that the faculty can attach to questions is 200x200 pixels.

F. Assumptions

1. Teachers creating the examinations should be given proper training on how to construct exam questions.
2. The faculty will be responsible enough in creating questions, and will not cause actions that may affect the generation of the exams.
3. The system time and date should be accurate.

II. Review of Related Literature

The implementation of K-12 in several school systems has been popular all over the world for the past decade. This system is still being adapted by many other academic learning institutions all over the world, and the Philippines is not an exception. For a long time, the Philippines has been using a 10-year public educational system. As a result, the Philippines, along with three other countries in the whole world, have been at a disadvantage especially when it came to working in other countries. The Philippines is generally looked down upon by countries implementing a 12-year public educational system.

Dr. Calderon described our educational system as congested, as each student's time to learn pre-college courses are pushed in 10 years rather than 12 years. A biggest problem this brings up is the fact that most high school students graduate without being fully taught on the basics to move on to a higher educational level. This also makes high school graduates less competent at work.

Dr. Calderon stated the importance of K-12 system being implemented in our country. As she stated on her paper, "the K to 12 is aimed at addressing the deficiency of the Philippine educational system particularly in the basic education, the elementary and high school, in order to meet the standards of the international education criteria and for the students to be at par with the students in neighboring countries." [5] Of course, all these numbers may vary, from each area in the country, but in general these facts point out that a reform is much needed if we wish to compete with other countries globally.

A paper covering the K-12 educational system published by De Justo, Digal, and Lagura concluded the opposite of what Dr. Calderon has stated. In their paper, they stated that the ideal

course of action is to impede the implementation of the policy. They insisted that the Philippine education sector is still unprepared for such change, and the program will yield more negative outcomes than positive ones.

However, Lagura et. al. agreed that our educational system is faulty in a sense that the time spent on academic learning institutes may be insufficient in acquiring all the necessary sets of skills and knowledge to move to a higher level of education. They have also stated that enhancing the education system of the Philippines is very crucial as this would, in the long term, affect the economy of the Philippines as a whole. [6]

As such, it is inconclusive whether or not the K-12 would be ideal right now. There are many aspects that we have not considered, including but not limited to its proper implementation. Of course, this problem has not only arisen in the the Philippines but also in other countries that has implemented or would be implementing the new education system.

A journal published by DiPietro, Ferdig, Black, and Preston, from the United States of America, tackles how K-12 study could be implemented using virtual schools. Though they have stated that more research needs to be conducted for more accurate data, they have stated that the introduction of virtual classrooms to the K-12 education system has provided a “hybrid learning environments where aspects of online learning are integrated into traditional, face-to-face settings.” [7] As they have stated, these results are inconclusive for now, but with further research on virtual classrooms and the K-12 system, more conclusive data could be drawn.

In a study conducted by J. Lynn McBrien and Phyllis Jones, they stated that using systems that promote online interaction in classrooms are inefficient. They said that such systems lack interaction between the student and the teachers, and thus “improved teaching and learning strategies are needed to provide students not only the convenience of distance education but also

the kind of access to real-time interaction with the instructor and class peers that simulates the traditional classroom setting.”

At the end, they concluded that such results are predictable with today’s technology, but can be expected to be improved upon as technology grows. There may come a time when the lack of interaction between the students and the teachers would be so minimal that the online learning experience would not be degraded. [8]

However, two writers, Palloff and Pratt, begged to disagree with McBrien and Jones’ conclusion. In a book they’ve published, they’ve found out that students are much more willing to participate in a discussion outside of a classroom. They stated that this may be due to two primary reasons: (1) student has more time to stop and think of an answer, while an answer is immediately required of a student in a class, and (2) “students can discuss openly and not have to worry about failure as much.” [9] With their results, we can assume that implementing an online virtual classroom may not be as counterproductive as once thought.

In an analysis conducted by Sitzmann, Kraiger, Stewart, and Wisher, the effectiveness of using WBI, or web-based instruction, and CI, or classroom instruction, were compared. In their paper, they talked about how WBI is favored in being used in academic learning institutes. This became the center of their analysis, as they have stated “it is important to understand whether or not this delivery medium is effective, whether it is more effective than other delivery media, and what contextual or methodological factors moderate its effectiveness.” In their analysis, they have concluded that, despite having several results that favor WBI over CI, CI was more effective in teaching declarative knowledge to respondents, yet are (Placeholder1) equally effective when using the same instructional methods to deliver training. However, they have stated that “designing long training courses and providing trainees with control, practice, and

feedback during WBI will maximize learning declarative knowledge from WBI relative to CI". [10] In other words, we can assume that web-based instruction can be improved upon to match the results of classroom instruction, or maybe even surpass the standards.

A study conducted by Chang and Smith "determined whether there was a relationship between students' perceptions of how effective course-related interaction was and their level of course satisfaction". In the fall of 2005, 949 students and 25 teaching assistants participated in their study. They found out that several attributes affect whether or not a classroom environment, whether face-to-face or online, would be successful in reaching out to students and making sure they understand the course. As for online classrooms, making sure that course quality is examined and checked, and assessing learner satisfaction are very crucial components in distance education courses. [11]

Merchant, Goetz, Cifuentes, Keeney-Kennicutt, and Davis took a different approach covering virtual learning. In their study, not only did they tackle online learning, but they also tackled about virtual reality being used in the present education system, especially in K-12 system. In their article, they described how financial feasibility hampered the widespread dissemination of virtual reality in K-12 and higher education systems. Here they explain that the cost of procuring the necessary devices (e.g. head-mounted display gear, body suits, and data gloves) for even the most basic functionalities of virtual reality would cost a lot, not to mention the cost of maintenance these devices would require. However, over time, as the development of said devices has improved their cost decreasing and internet connection improving, the implementation of virtual reality to education systems has begun to grow.

In the end, they have concluded in their study that using VR was quite effective, but the results may be inconclusive as the findings have several limitations. They also emphasized the

fact that many studies had provided incomplete information on the variables for their study. [12] However, in accordance with their own study, they concluded that using virtual reality in education systems like K-12 would be effective if not slightly costly.

Another group of researchers, Ju-Ling Shih, Chien-Wen Chuang, and Gwo-Jen Hwang, took a different approach at looking at online classrooms. In their study, they looked upon whether using mobile devices and wireless communications would help students learn in a social science activity. Their results showed that the student's performances have improved overall, whether it is their cognitive learning achievements, their satisfaction level, or their physical participation and affective involvement in the respective activities, as well as the appraisal they received from their teachers, compared to traditional classroom lectures. [13] This further supports the case that online learning isn't necessarily worse than traditional learning, and, in some cases, it might even surpass traditional learning.

A previous study was conducted by Mark Manalang, a UP Manila Alumni. In his work, he created a web-based examination system and tutorial scheduling system for the UP Manila Learning Resource Center. He called this project TOES (Tutorial and Online Examination System), who cater to the following users: student, tutor, staff, admin, and director. He focused on the problem of the LRC about giving mock examinations, which is done manually. He stated that some written answers are not easily readable and may be corrected improperly. He also addressed the problem of how the files were stored; stating that keeping the data in paper and storing them in folders slows down the process of retrieval of questions. Lastly, he noted the system of how the schedules are posted which, as he stated, "fail to get the attention of students".

In his work, he recommended that it would be more efficient if TOES had its own question editor. He also stated that registration and reactivation of student account is frustrating

as it would involve encoding over thousand student information, and it be wise if the system could access an existing UP Manila database and extract the required records to avoid hassle.

[14]

III. Theoretical Framework

A. Dee Hwa Liong Academy

Dee Hwa Liong Academy will be implementing the new K-12 system next school year. Because of this, several protocols have been changed in the school, and the school itself is in the process of adjusting to the new system. Because of their massive student population size, the management of the school could find it challenging to organize and oversee every student along the way. There is also the issue of keeping student records and the like, which are important not only for the school, but also for the students.

One of the solutions proposed is creating an online learning portal, an online learning community. With the said system, the load of the faculty will be definitely lighter, and since most of the work will be done by computers, errors made by the faculty will be significantly reduced.

B. Information System

An IS (information system) is the collection of technical and human resources that provide the storage, computing, distribution, and communication for the information required by all or some part of an enterprise. [15] It is made up of the database, application programs and manual and machine procedures. It also encompasses the computer systems that do the processing. [16]

C. Database Management System

MySQL is a freely available open source Relational Database Management System (RDBMS) that uses Structured Query Language (SQL). SQL is the most popular language for adding, accessing and managing content in a database. It is most noted for its quick processing, proven reliability, ease and flexibility of use. MySQL is an essential part of almost every open source PHP application. Good examples for PHP/MySQL-based scripts are phpBB, osCommerce and Joomla.

MySQL, the most popular Open Source SQL database management system, is developed, distributed, and supported by Oracle Corporation. [17]

D. Laravel

Laravel is a web application framework with expressive, elegant syntax. The developers believe development must be an enjoyable, creative experience to be truly fulfilling. Laravel attempts to take the pain out of development by easing common tasks used in the majority of web projects, such as authentication, routing, sessions, and caching.

Laravel aims to make the development process a pleasing one for the developer without sacrificing application functionality. Happy developers make the best code. To this end, the developers have attempted to combine the very best of what we have seen in other web frameworks, including frameworks implemented in other languages, such as Ruby on Rails, ASP.NET MVC, and Sinatra.

Laravel is accessible, yet powerful, providing powerful tools needed for large, robust applications. A superb inversion of control container, expressive migration system, and tightly

integrated unit testing support give you the tools you need to build any application with which you are tasked. [18]

E. Scripting Language

PHP, which stands for “PHP: Hypertext Processor”, is a web-based server-side scripting language that is often used in web development. It can be embedded into HTML. PHP can be used on all major operating systems, including Linux, many UNIX variants (including HP-UX, Solaris and OpenBSD), Microsoft Windows, Mac OS X, RISC OS, and others. The greatest advantage of using PHP is having the freedom of choosing an operating system and a web server. Furthermore, you also have the choice of using procedural programming or object oriented programming (OOP), or a mixture of them both. [19]

JavaScript (often shortened to JS) is a lightweight, interpreted, object-oriented language with first-class functions, most known as the scripting language for Web pages, but used in many non-browser environments as well. It is a prototype-based, multi-paradigm scripting language that is dynamic, and supports object-oriented, imperative, and functional programming styles. Javascript can be classified as client-side scripting, and can respond to mouse events, form inputs, and page navigation when embedded on HTML pages. [20]

IV. Design and Implementation

A. Entity-Relationship Diagram

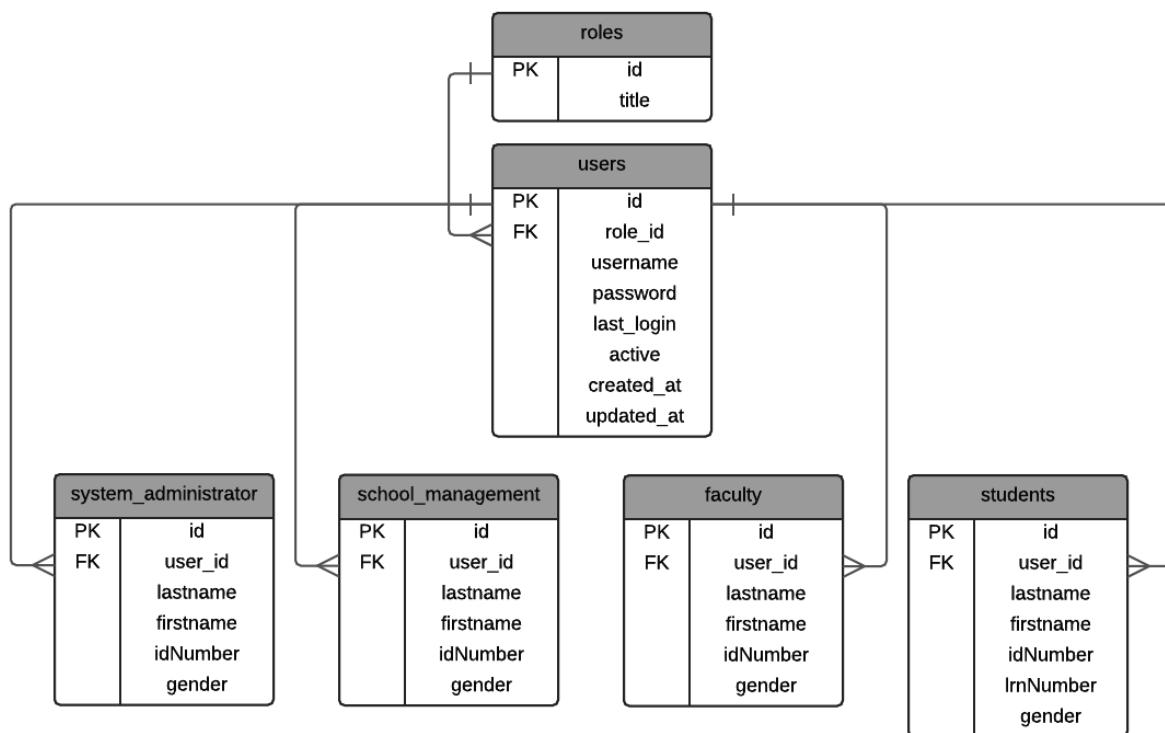

Figure 1: Users and their details

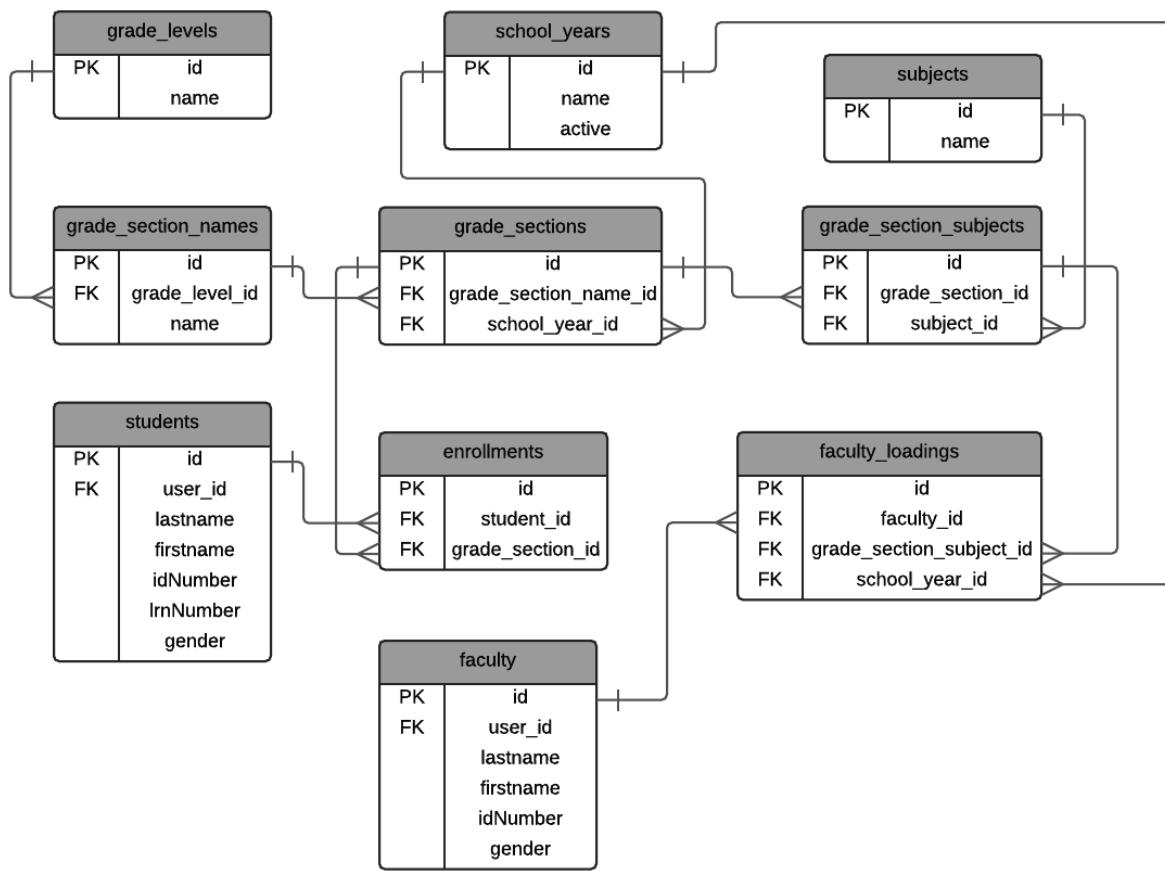

Figure 2: Management of grade subject sections, enrollment of users, assignment of subjects, and assignment of faculty to grade subject section

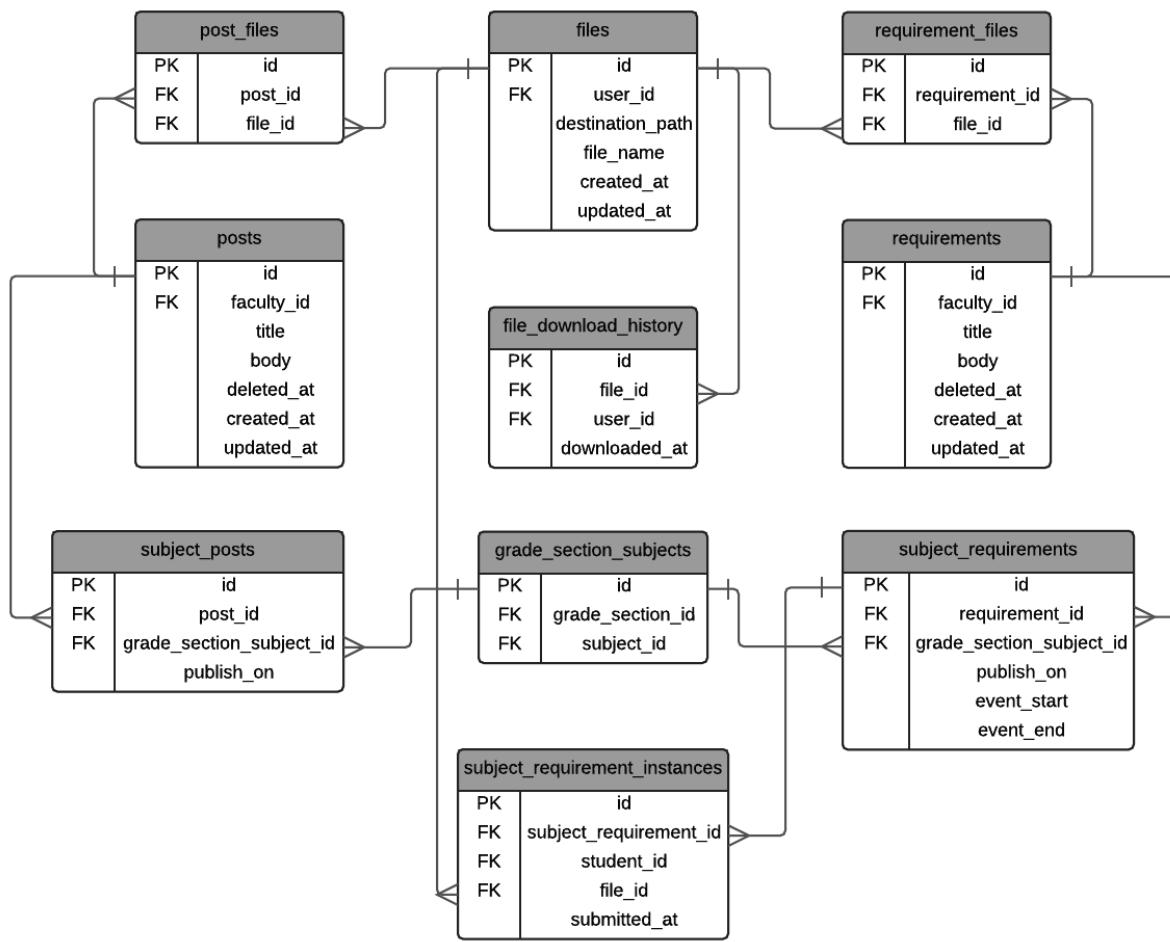

Figure 3: Creation of subject posts and requirements, handling user submissions for a particular requirement, and management of files

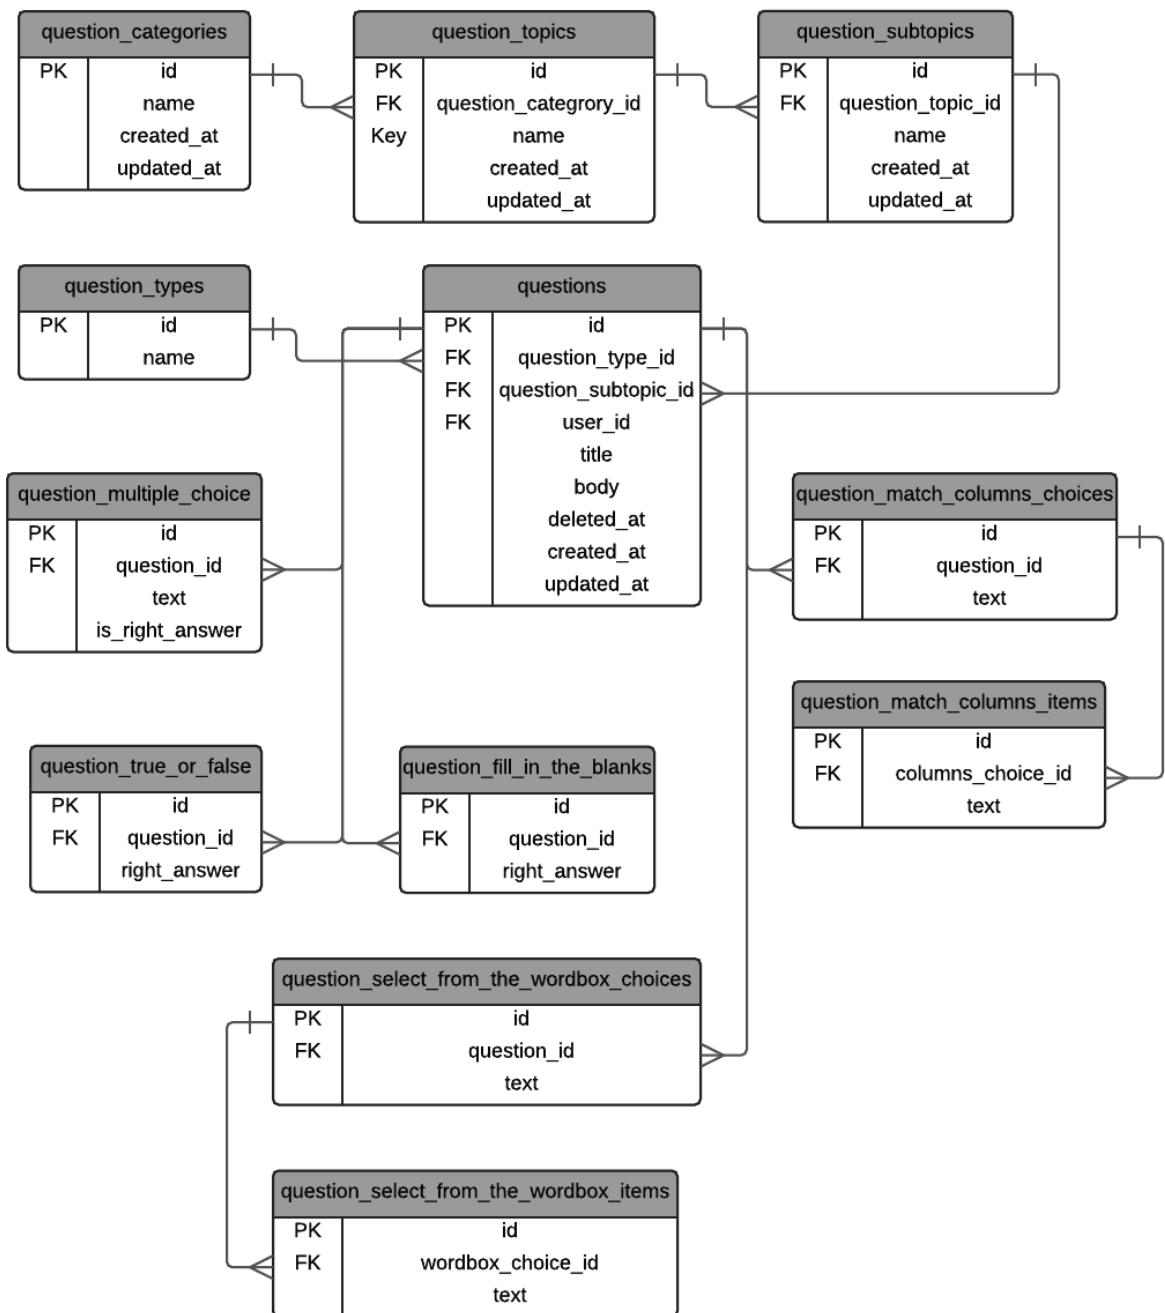

Figure 4: Questions and its different types

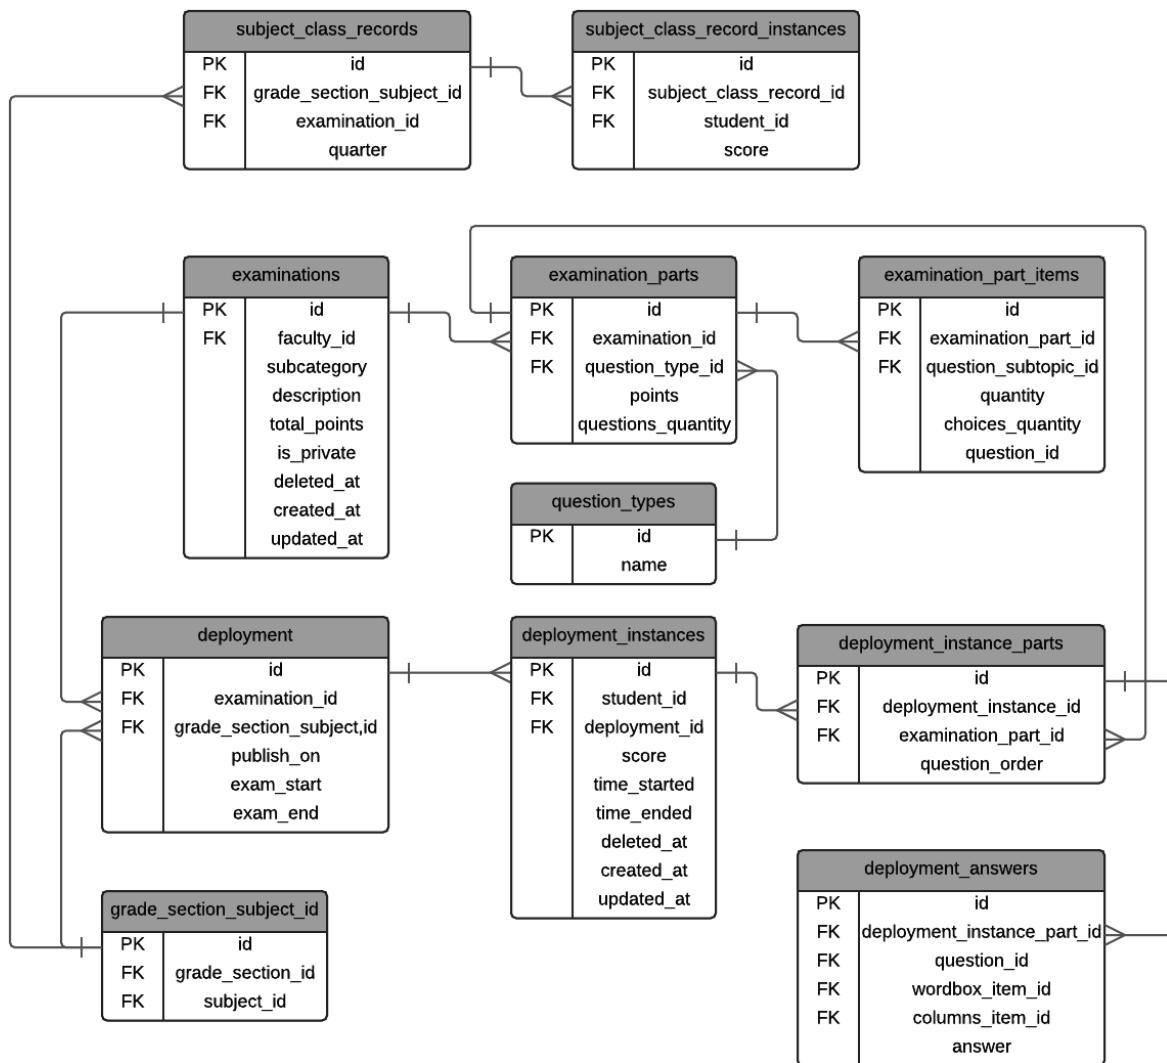

Figure 5: Creating examinations and recording it to the subject class record

B. Data Flow

The system can be classified into two parts. One module is about the online examination, and the other module is about the online portal.

For the online examination, here is how the process goes:

1. Uploading of questions in the question bank

- a. The faculty navigates through the categories, topics, and subtopics. The faculty will have to select from what subtopic the question will be added.
- b. In case the faculty wishes to create new categories, topics, or subtopics, he/she may do so. The faculty would just need to provide a name for the category. The faculty would provide a name for the topic, as well as which category it falls under. The faculty would provide a name for the subtopic, as well as which topic it falls under.
- c. The faculty decides on what type of question to be created. They can select from five different types of exam: multiple choice, match column a with column b, true or false, fill in the blanks, and select from the wordbox.
- d. Depending on the type of question, the faculty will provide the necessary details of the question.
- e. This process can be done repeatedly until the desired number of questions has been created.

2. Creating an examination

- a. The faculty logs in into his account and sees the examination tab on his home page.
- b. The faculty then proceeds to fill out the header, or the details to be used in a class record.
- c. The faculty then proceeds to create parts for the exam. These part require a given question type parameter as well as the maximum quantity of questions that could be added in a part.

- d. Once a part has been created, the faculty then will create items. The way items are created is by randomly selecting questions from a given subtopic a faculty has chosen.
- e. The faculty also specifies the quantity of questions that will be taken from a given subtopic.
- f. The faculty repeats the process of creating parts and items until he/she is satisfied.
- g. The exams are then given out to the selected grade sections. The faculty will also specify other parameters upon assigning an examination, which includes publish date and time.

3. Taking the exam

- a. A student, given that he/she has permission to answer the exam (which means that they are enrolled in the section that is taking the examination) can start answering it as soon as the examination is published, and the time allotted for the exam is still sufficient.
- b. The exam questions are shown one part at a time. The questions are grouped together by what their question types are. The user can answer the current question, skip the question, or go back to the previous questions.
- c. Upon answering a page, the exams are automatically recorded. The student may then go back to his/her previous answers to review and/or change them.
- d. If the student is satisfied with his/her answers, he/she may finish the exam. The results of the exam will then be shown to the user.

4. Checking the exam

- a. The system automatically checks the exam, records the score, stores it in the records database, then prevents the student from taking the exam again.
- b. A copy of the exam questions, the answers chosen by the student, the correct answers for the question, and the total points the student got will be recorded. This data can be viewed later on by the faculty only.

For the online portal, here is how the process goes:

1. Creation of tables

- a. The system administrator can create new users who can use the system. The system administrator would also have to specify certain details about that user, including their last name, first name, etc.
- b. The system administrator would also be able to enroll a given set of students to a given grade section.
- c. Subject would also be assigned to a grade section.
- d. The system administrator then proceeds to assign faculty to each respective grade section subject.
- e. This process is repeated until all students have been enrolled, all sections have been assigned all their respective subjects, and all subjects studied by each section have an assigned faculty to it.

2. User login

- o If a student has logged in, he/she will immediately see the list of subjects that his/her section is currently taking. Upon clicking on one of his/her subjects, he

would see articles the faculty for that subject has posted. These articles include posts, requirements, and examinations.

- If a faculty has logged in, he/she would see the links in creating and managing posts, requirements, and examinations. The list of grade section subjects he/she is handling will also be listed as well.
- If a school management has logged in, there would be links to different parts of the system that he/she may view. This includes the events in any given grade section subject.
- If a system administrator has logged in, he/she will see the main menu of creating user accounts, subjects, grade sections, as well as changing the school year.

3. Creating subject requirements

- a. Upon login, a faculty will see the requirements tab, which will enable him/her to see all requirements he/she has created, as well as create new ones.
- b. The faculty provides the necessary information for the requirement.
- c. Before the faculty could submit the form, he/she will have to specify which grade sections would be able to receive the requirement (can be edited later).
- d. The faculty sets a time and date when the event would start and end, or in other words when the students will be able to see the requirement and when the deadline will be. This is done for each grade section that the faculty has selected.

4. Submitting a subject requirement

- a. The student opens up the class he has a requirement on
- b. The student selects the requirement post
- c. The student uploads the requirement needed

- d. The date and time when the upload was done will be recorded
- e. As long as the requirement period is not over yet, the student may upload a new file to submit. Take note that the previous one will be deleted.

5. Creating subject posts

- a. Upon login, a faculty will see the posts tab, which will enable him/her to see all posts he/she has created, as well as create new ones.
- b. The faculty provides the necessary information for the post.
- c. Before the faculty could submit the form, he/she will have to specify which grade sections would be able to receive the post (can be edited later).
- d. The faculty sets a time and date when the post will be published on each student's wall. This is done for each grade section that the faculty has selected.

6. Downloading of subject files

- a. The students view any requirement/post that has files attached to it.
- b. The user click on the file name, then the file will be downloaded.
- c. The date and time when the download was made will be recorded.

C. Data Dictionary

deployments

Field	Type	Description
id	bigInteger	Unique identifier of the table
examination_id	bigInteger	Foreign key to “examinations” table
grade_section_subject_id	bigInteger	Foreign key to “grade_section_subjects” table
publish_on	dateTime	Marks when the examination will be published

exam_start	dateTime	Marks when the examination would be answerable by the students
exam_end	dateTime	Marks the end of the examination

deployment_answers

Field	Type	Description
id	bigInteger	Unique identifier of the table
deployment_instance_part_id	bigInteger	Foreign key to “deployment_instance_parts” table
question_id	bigInteger	Foreign key to “questions” table
wordbox_item_id	bigInteger	Nullable except when the question type is “Select from the Wordbox”
columns_item_id	bigInteger	Nullable except when the question type is “Match Column A with Column B”
answer	string	The answer of the student

deployment_instances

Field	Type	Description
id	bigInteger	Unique identifier of the table
deployment_id	bigInteger	Foreign key to “deployments” table
user_id	bigInteger	Foreign key to “users” table
score	integer	The final score of the student
time_started	timestamp	Marks when the student has begun answering the examination
time_ended	timestamp	Marks when the student has finished answering the examination
is_finished	boolean	Determines if the student is finished answering the examination

deleted_at	timestamp	Marks when the instance has been deleted (usually for faculty)
created_at	timestamp	Marks the time the instance is created
updated_at	timestamp	Marks the time the instance was last updated

deployment_instance_parts

Field	Type	Description
id	bigInteger	Unique identifier of the table
deployment_instance_id	bigInteger	Foreign key to “deployment_instances” table
examination_part_id	bigInteger	Foreign key to “examination_parts” table
question_order	string	A sequence of question id separated by a “ ” character. These questions are the questions selected for the given deployment part of the instance.

enrollments

Field	Type	Description
id	bigInteger	Unique identifier of the table
user_id	bigInteger	Foreign key to “users” table
grade_section_id	bigInteger	Foreign key to “grade_sections” table

examinations

Field	Type	Description
id	bigInteger	Unique identifier of the table
user_id	bigInteger	Foreign key to “users” table
subcategory	string	Determines in what subcategory of the class record the examination will be recorded to

description	string	A short description about the examination
total_points	integer	Total points of the examination
deleted_at	timestamp	Marks when the examination has been deleted
created_at	timestamp	Marks when the examination has been created
updated_at	timestamp	Marks when the examination was last updated

examination_parts

Field	Type	Description
id	bigInteger	Unique identifier of the table
examination_id	bigInteger	Foreign key to “examinations” table
question_type_id	bigInteger	Foreign key to “question_types” table
points	integer	Show how much each correct answer is worth in score
questions_quantity	integer	The exact number of questions this part can have

examination_part_items

Field	Type	Description
id	bigInteger	Unique identifier of the table
examination_part_id	bigInteger	Foreign key to “examination_parts” table
question_subtopic_id	bigInteger	Foreign key to “question_subtopics” table
quantity	integer	The number of questions the system will get from the chosen subtopic
choices_quantity	integer	Null for all other question types except for “Match Column A with Column B”. Determines the number of wrong choices to be thrown in the mix
question_id	bigInteger	Nullable except for “Match Column A with Column B” and “Select from the Wordbox”. Determines the question chosen for the given

		examination part
--	--	------------------

faculty

Field	Type	Description
id	bigInteger	Unique identifier of the table
user_id	bigInteger	Foreign key to “users” table
lastname	string	Lastname of user
firstname	string	Firstname of user
idNumber	string	A unique identifier used in DHLA
gender	boolean	Determines the gender of the user

faculty-loadings

Field	Type	Description
id	bigInteger	Unique identifier of the table
grade_section_subject_id	bigInteger	Foreign key to “grade_section_subject_id” table
user_id	bigInteger	Foreign key to “users” table
school_year_id	bigInteger	Foreign key to “school_years” table

files

Field	Type	Description
id	bigInteger	Unique identifier of the table
user_id	bigInteger	Foreign key to “users” table
destination_path	string	Determines the destination path where the file is located
file_name	string	Name of the file

file_download_history

Field	Type	Description
id	bigInteger	Unique identifier of the table
file_id	bigInteger	Foreign key to “files” table
user_id	bigInteger	Foreign key to “users” table
downloaded_at	timestamp	Marks when the file has been downloaded by the given user

grade_levels

Field	Type	Description
id	bigInteger	Unique identifier of the table
name	string	The name of the grade level

grade_sections

Field	Type	Description
id	bigInteger	Unique identifier of the table
grade_section_name_id	bigInteger	Foreign key to “grade_section_names” table
school_year_id	bigInteger	Foreign key to “school_years” table

grade_section_names

Field	Type	Description
id	bigInteger	Unique identifier of the table
grade_level_id	bigInteger	Foreign key to “grade_levels” table
name	string	Name of grade section

grade_section_subjects

Field	Type	Description
id	bigInteger	Unique identifier of the table
grade_section_id	bigInteger	Foreign key to “grade_sections” table
subject_id	bigInteger	Foreign key to “subjects” table

posts

Field	Type	Description
id	bigInteger	Unique identifier of the table
user_id	bigInteger	Foreign key to “users” table
title	string	Title of the post
body	textarea	Contains the message of the post
deleted_at	timestamp	Marks the time when the post was deleted
created_at	timestamp	Marks the time when the post was created
updated_at	timestamp	Marks the time when the post was last updated

post_files

Field	Type	Description
id	bigInteger	Unique identifier of the table
post_id	bigInteger	Foreign key to “posts” table
file_id	bigInteger	Foreign key to “files” table

questions

Field	Type	Description
id	bigInteger	Unique identifier of the table

question_subtopic_id	bigInteger	Foreign key to “question_subtopics” table
question_type_id	bigInteger	Foreign key to “question_types” table
title	string	Title of the question
body	string	Contains the message of the question
deleted_at	timestamp	Marks the time when the question was deleted
created_at	timestamp	Marks the time when the question was created
updated_at	timestamp	Marks the time when the question was last updated

question_categories

Field	Type	Description
id	bigInteger	Unique identifier of the table
name	string	Name of the category
created_at	timestamp	Marks the time when the category was created
updated_at	timestamp	Marks the time when the category was last updated

question_fill_in_the_blanks

Field	Type	Description
id	bigInteger	Unique identifier of the table
question_id	bigInteger	Foreign key to “questions” table
right_answer	string	The correct answer

question_match_columns_choices

Field	Type	Description
id	bigInteger	Unique identifier of the table

question_id	bigInteger	Foreign key to “questions” table
text	string	The text message of the choice

question_match_columns_items

Field	Type	Description
id	bigInteger	Unique identifier of the table
columns_choice_id	bigInteger	Foreign key to “question_match_columns_choice” table
text	string	The text message of the item

question_multiple_choice

Field	Type	Description
id	bigInteger	Unique identifier of the table
question_id	bigInteger	Foreign key to “questions” table
text	string	The text message of the choice
is_right_answer	boolean	The correct answer

question_select_from_the_wordbox_choices

Field	Type	Description
id	bigInteger	Unique identifier of the table
question_id	bigInteger	Foreign key to “questions” table
text	string	The text message of the choice

question_select_from_the_wordbox_item

Field	Type	Description

id	bigInteger	Unique identifier of the table
wordbox_choice_id	bigInteger	Foreign key to “question_select_from_the_wordbox_choices” table
text	string	The text message of the choice

question_subtopics

Field	Type	Description
id	bigInteger	Unique identifier of the table
question_topic_id	bigInteger	Foreign key to “question_topics” table
name	string	Name of the topic
created_at	timestamp	Marks the time when the subtopic was created
updated_at	timestamp	Marks the time when the subtopic was last updated

question_topics

Field	Type	Description
id	bigInteger	Unique identifier of the table
question_category_id	bigInteger	Foreign key to “question_categories” table
name	string	Name of the topic
created_at	timestamp	Marks the time when the topic was created
updated_at	timestamp	Marks the time when the topic was last updated

question_true_or_false

Field	Type	Description
id	bigInteger	Unique identifier of the table

question_id	bigInteger	Foreign key to “questions” table
right_answer	boolean	The correct answer

question_types

Field	Type	Description
id	bigInteger	Unique identifier of the table
name	string	Name of the question type

requirements

Field	Type	Description
id	bigInteger	Unique identifier of the table
user_id	bigInteger	Foreign key to “users” table
title	string	Title of the requirement
body	textarea	Contains the message of the requirement
deleted_at	timestamp	Marks the time when the requirement was deleted
created_at	timestamp	Marks the time when the requirement was created
updated_at	timestamp	Marks the time when the requirement was last updated

requirement_files

Field	Type	Description
id	bigInteger	Unique identifier of the table
requirement_id	bigInteger	Foreign key to “requirements” table
file_id	bigInteger	Foreign key to “files” table

roles

Field	Type	Description
id	bigInteger	Unique identifier of the table
name	string	The name of the role

school_management

Field	Type	Description
id	bigInteger	Unique identifier of the table
user_id	bigInteger	Foreign key to “users” table
lastname	string	Lastname of user
firstname	string	Firstname of user
idNumber	string	A unique identifier used in DHLA
gender	boolean	Determines the gender of the user

school_years

Field	Type	Description
id	bigInteger	Unique identifier of the table
name	string	The name of the school year
active	boolean	Determines the current school year

students

Field	Type	Description
id	bigInteger	Unique identifier of the table
user_id	bigInteger	Foreign key to “users” table
lastname	string	Lastname of user

firstname	string	Firstname of user
idNumber	string	A unique identifier used in DHLA
lrnNumber	string	An identifier unique for every student in the country
gender	boolean	Determines the gender of the user

subjects

Field	Type	Description
id	bigInteger	Unique identifier of the table
name	string	Name of the subject

subject_class_records

Field	Type	Description
id	bigInteger	Unique identifier of the table
grade_section_subject_id	bigInteger	Foreign key to “grade_section_subjects” table
examination_id	bigInteger	Foreign key to “examinations” table
quarter	integer	Tells in what quarter the examination belongs to

subject_class_record_instances

Field	Type	Description
id	bigInteger	Unique identifier of the table
subject_class_record_id	bigInteger	Foreign key to “subject_class_records” table
user_id	bigInteger	Foreign key to “users” table
score	integer	The score the student got from the examination

subject_post

Field	Type	Description
id	bigInteger	Unique identifier of the table
post_id	bigInteger	Foreign key to “posts” table
grade_section_subjet_id	bigInteger	Foreign key to “grade_section_subjects” table
publish_on	dateTime	Marks the time when the post will be published

subject_requirements

Field	Type	Description
id	bigInteger	Unique identifier of the table
requirement_id	bigInteger	Foreign key to “requirements” table
grade_section_subjet_id	bigInteger	Foreign key to “grade_section_subjects” table
publish_on	dateTime	Marks the time when the requirement will be published
event_start	dateTime	Marks the time when the requirement article will be open for submission
event_end	dateTime	Marks the time when the requirement article will no longer accept submissions

subject_requirement_instances

Field	Type	Description
id	bigInteger	Unique identifier of the table
subject_requirement_id	bigInteger	Foreign key to “subject_requirements”
file_id	bigInteger	Foreign key to “files” table
user_id	bigInteger	Foreign key to “users” table
downloaded_at	timestamp	Marks when the file has been downloaded by the given user

system_administrator

Field	Type	Description
id	bigInteger	Unique identifier of the table
user_id	bigInteger	Foreign key to “users” table
lastname	string	Lastname of user
firstname	string	Firstname of user
idNumber	string	A unique identifier used in DHLA
gender	boolean	Determines the gender of the user

users

Field	Type	Description
id	bigInteger	Unique identifier of the table
username	string	Account name used for logging in
password	string	String for used for login verification
role_id	bigInteger	Foreign key to “roles” table
last_login	timestamp	Marks the last time the user has logged in
active	boolean	Determines whether the account is active
created_at	timestamp	Marks when the account was created
updated_at	timestamp	Marks when the account was last updated

D. System Architecture

The system uses Laravel as its base framework. Laravel uses an MVC (Model-View-Controller) architectural pattern. As defined by Margaret Rouse, “The MVC pattern has been

heralded by many developers as a useful pattern for the reuse of object code and a pattern that allows them to significantly reduce the time it takes to develop applications with user interfaces.”

[21]

The system also uses the following libraries/softwares:

1. Composer

The developer also recommends the use of composer. Although technically not required, installing Composer is highly recommended because it makes installing Laravel a lot easier, as well as other PHP libraries or frameworks you may desire to use.

2. Laravel Collective

Laravel Collective is a library recommended by Laravel developers. Laravel Collective contains functions that enable the creation of forms with ease. It is completely optional in creating Laravel systems, but is highly recommended because of its usability.

3. Laracasts Flash

Laracasts Flash provides an easy way to insert flash messaging into your system. Flash messages are a great way to convey messages to users, especially notifications on whether or not an action by the user is successful or has failed.

4. nicEdit WYSIWYG Content Editor

The system requires fully customizable messages to be created, and nicEdit editor provides a great way to implement this. Installing the library can enable selected normal form text areas to be converted to nicEdit editors which has functionalities that allow formatting of texts, including but not limited to paragraph alignment, fonts, bold, italics, underlines, lists, and inserting images and links in the text.

It should be noted, however, that the developer has customized the nicEditor to allow storage of images locally. The images were originally meant to be uploaded to an external site, but as per client request the location has been changed.

5. Laravel Random

Laravel Random is an external PHP library made for the Laravel framework which, as the name suggests, lets you generate random strings consisting of either alphanumeric characters, special characters, or both. This is useful in generating temporary password values, generating short keys, and the like.

E. Technical Architecture

1. PHP 7

Laravel entirely depends on PHP 7. PHP 7 has new functionality that is vital on making controller, view, middleware, database migrations, and almost any other Laravel objects.

Aside from installing PHP 7, the extensions OpenSSL, PDO, Mbstring, and Tokenizer must also be enabled.

2. Apache 2.4

The system requires installing at least version 2.4 of Apache. The software is free to download on the Apache website.

3. Microsoft Visual C++ 2015

The system also requires the 2015 version of Microsoft Visual C++. The software is free to download on the Microsoft website and is used to install both the Apache and the Laravel Framework itself.

V. Results

The Dee Hwa Liong Academy Virtual Classroom is an online (although also accessible offline) student and faculty learning portal. The aim of the system is to create a bridge between students and faculty whenever direct confrontation is not applicable. The system has many functionalities, as well as web pages, sorted by user.

A. Welcome pages

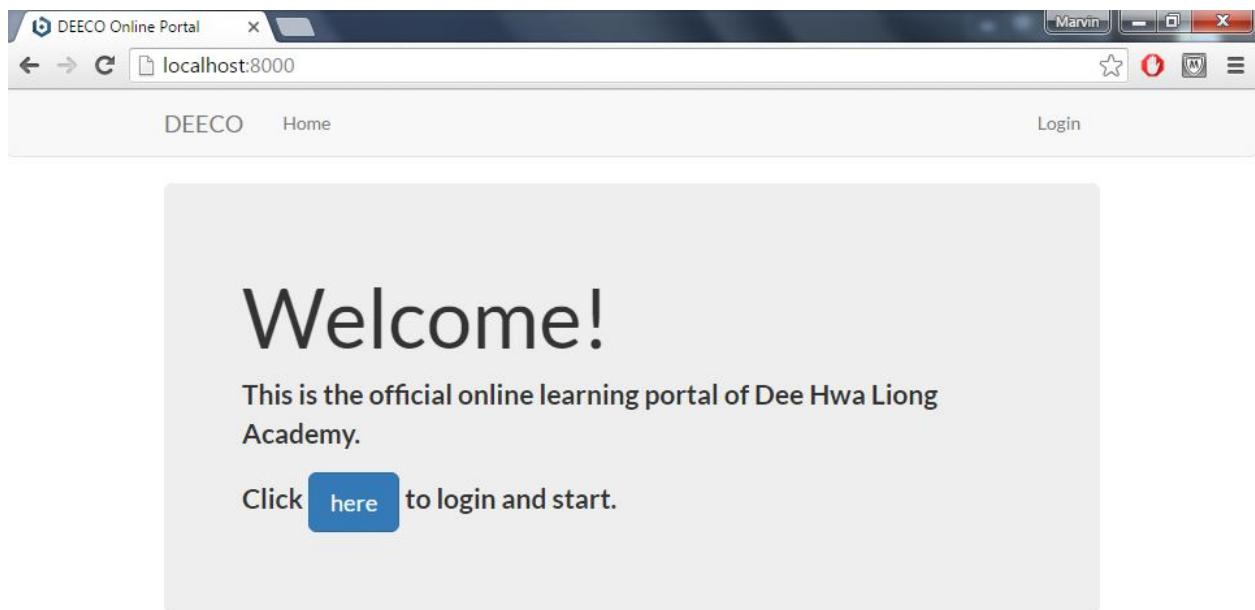

Fig. 6: Showing the welcome page of the site

The screenshot shows a web browser window with the title bar "Login" and the URL "localhost:8000/login". The main content area displays a "Login" form. At the top left of the form is the word "Login". Below it are two input fields: one labeled "Username" and another labeled "Password", both with placeholder text. At the bottom of the form is a blue "Login" button with a white icon.

Figure 7: Showing the login page

The screenshot shows a web browser window with the title bar "Change password" and the URL "localhost:8000/password/change". The main content area displays a "Change password" form. At the top left of the form is the title "Change password". Below it are three input fields: "Old password:", "New password:", and "Confirm new password:", each with a placeholder text. At the bottom right of the form are two buttons: "Generate Password" (disabled) and "Change Password". Above the "Change Password" button, the user "admin" is listed in the top right corner.

Figure 8: Showing the password change form. This is, of course, only available to registered users.

B. System Administrator pages

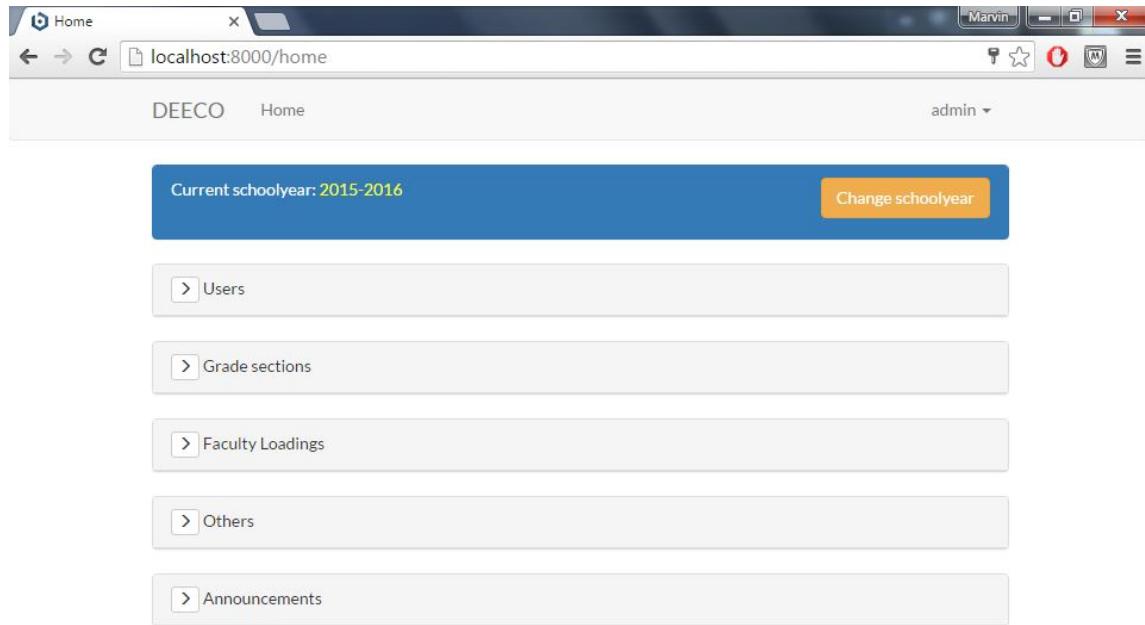

Figure 9: Home page of the system administrator upon login

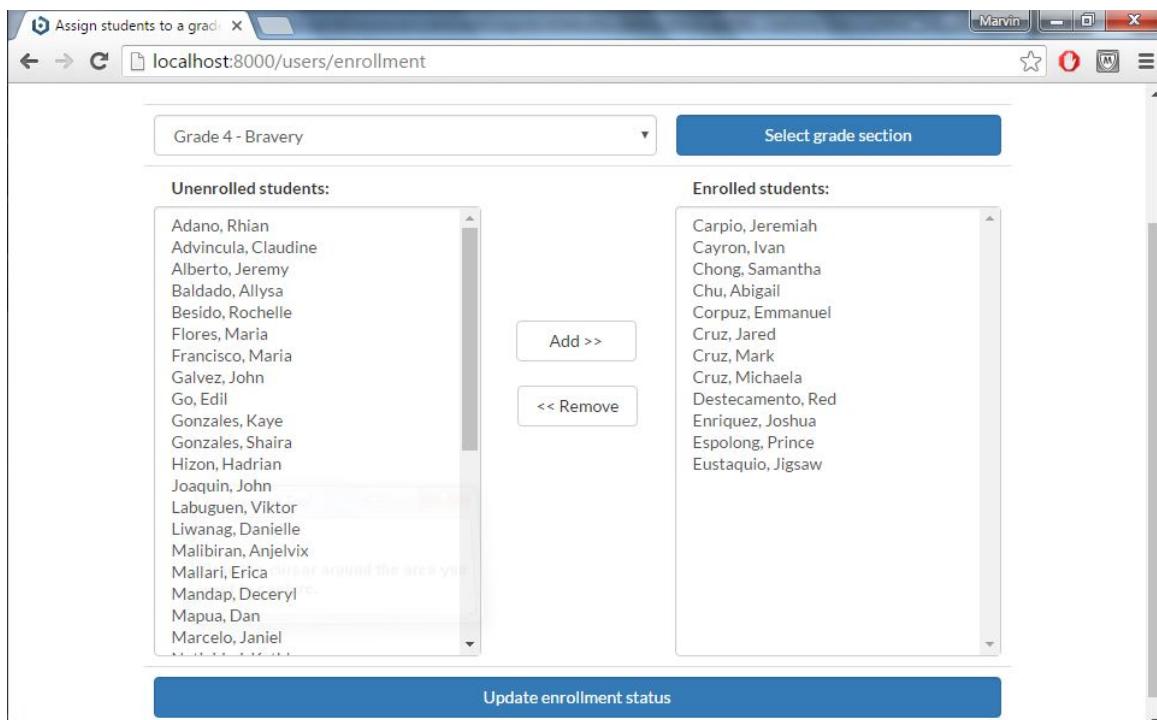

Figure 10: Enrolling students to a selected grade section

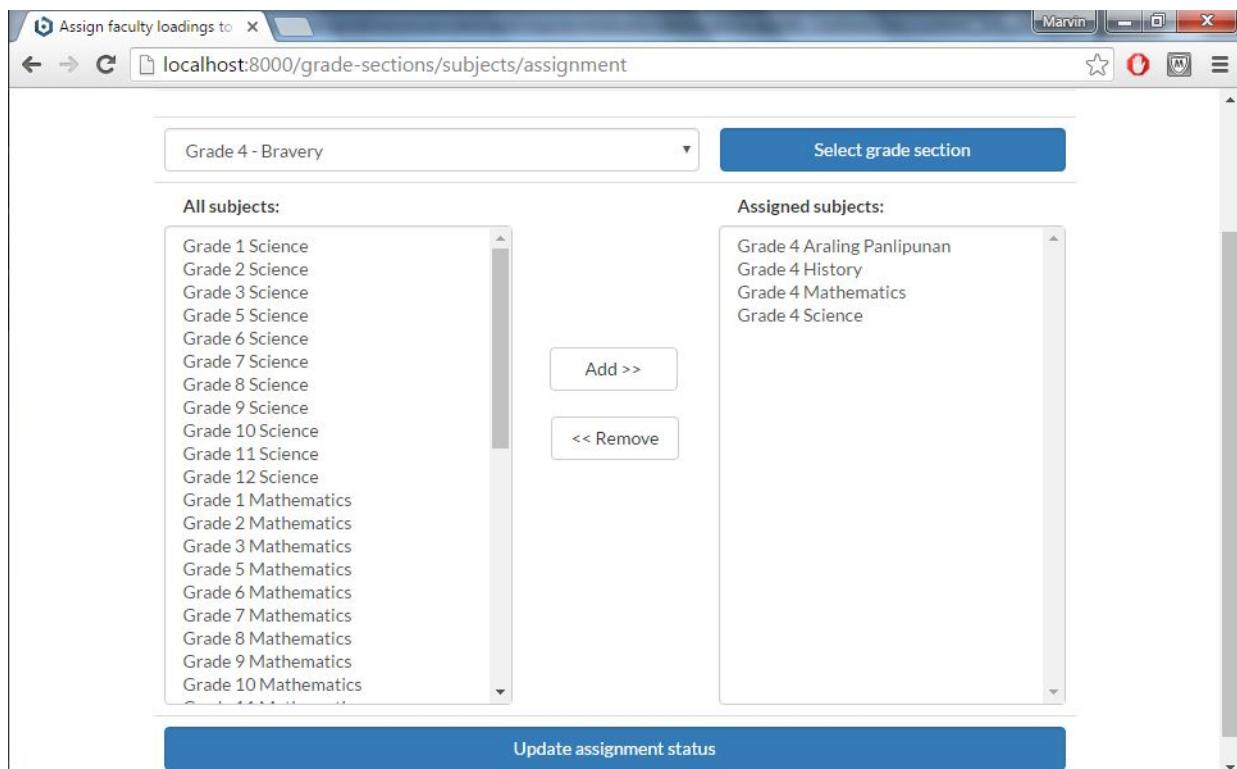

Figure 11: Assigning subjects to a grade section

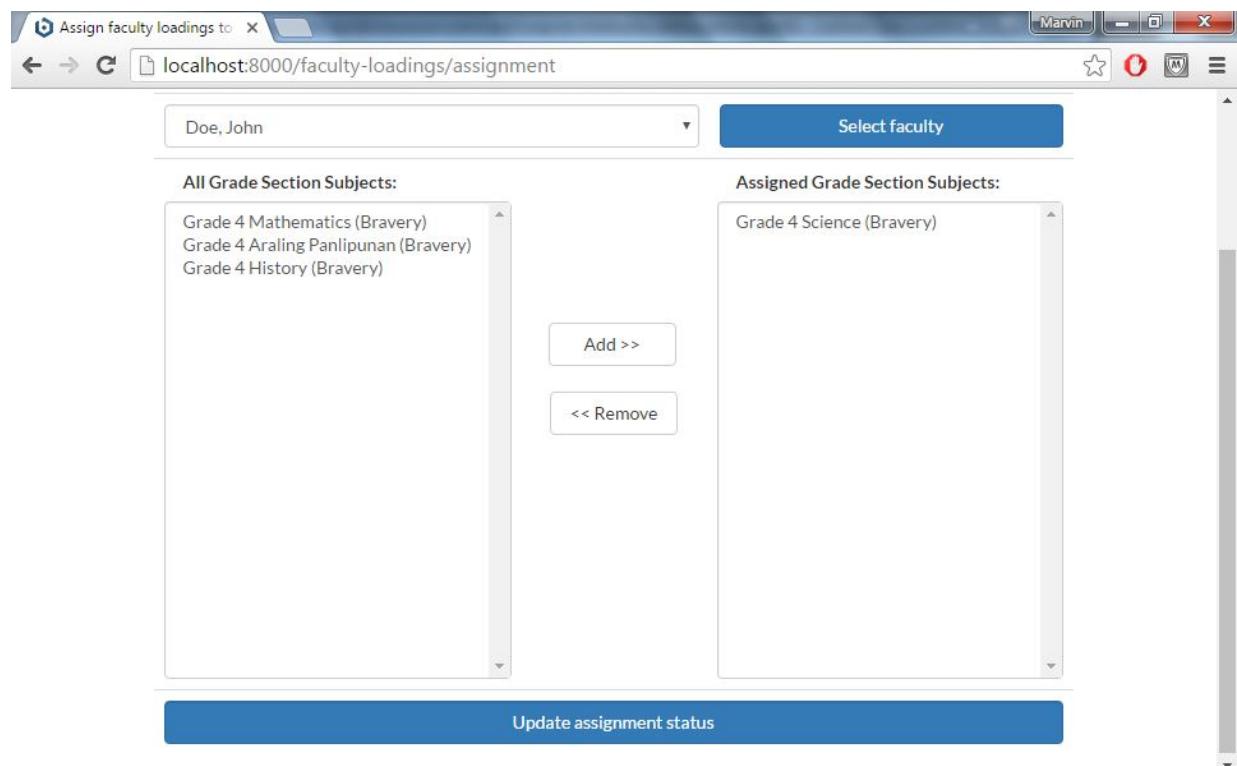

Figure 12: Assigning grade section subjects to a faculty

C. Faculty Pages

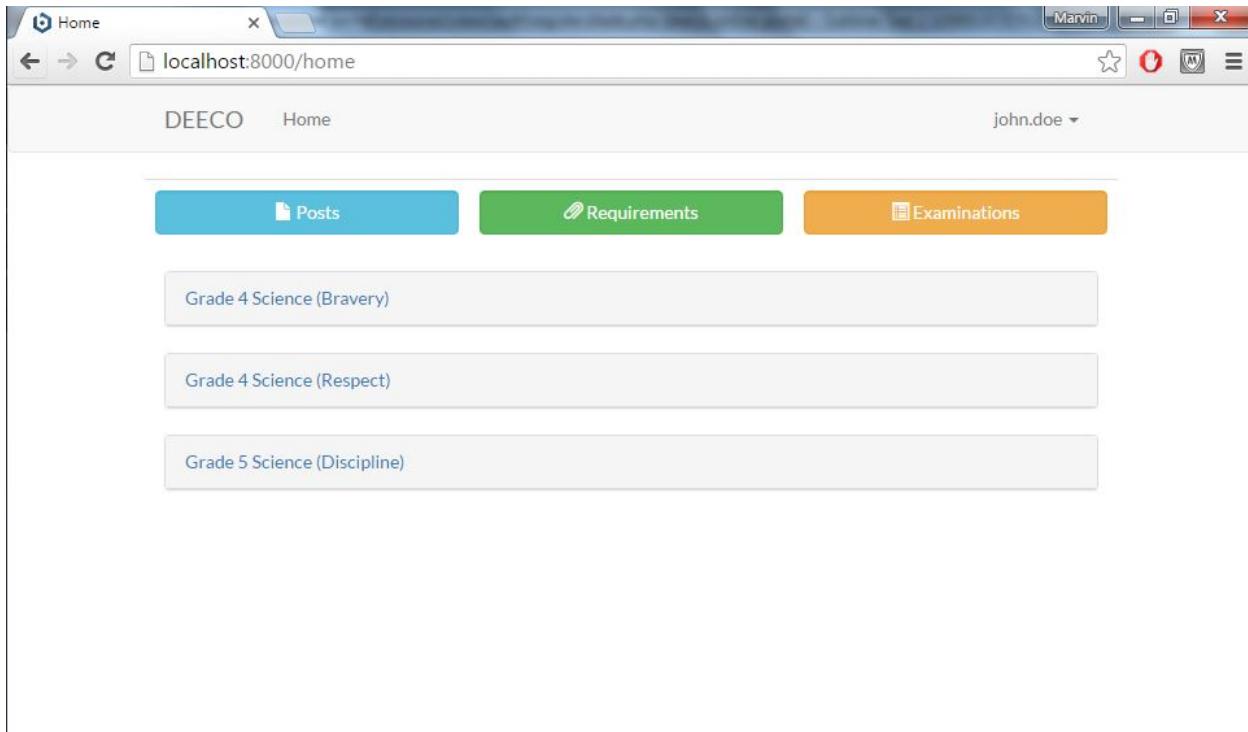

Figure 13: Home page of the faculty upon login

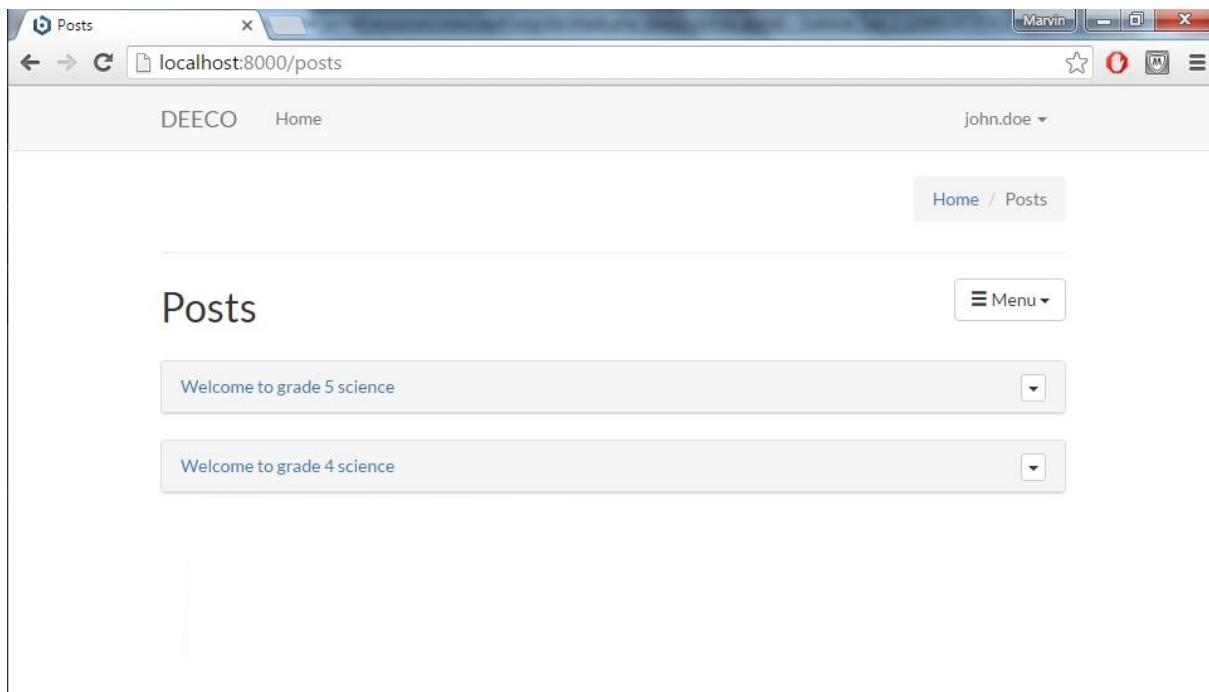

Figure 14: List of posts available for publishing

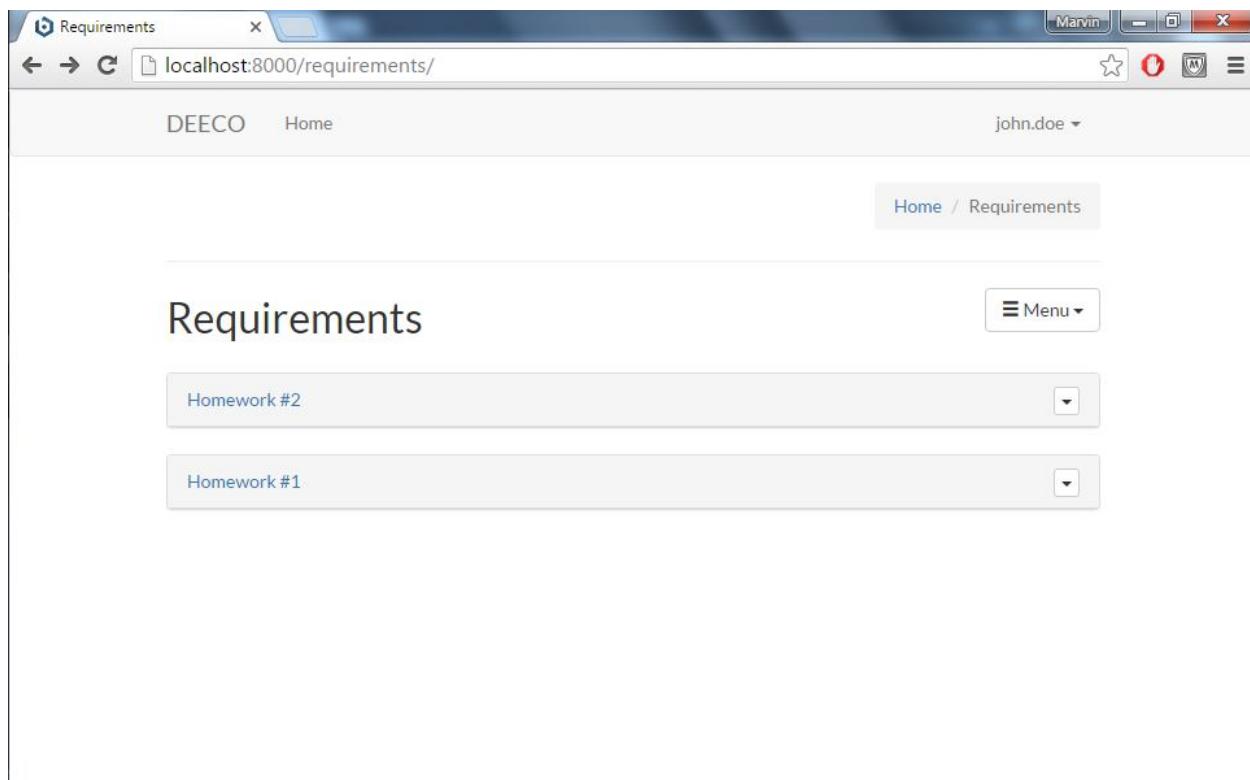

Figure 15: List of requirements available for publishing

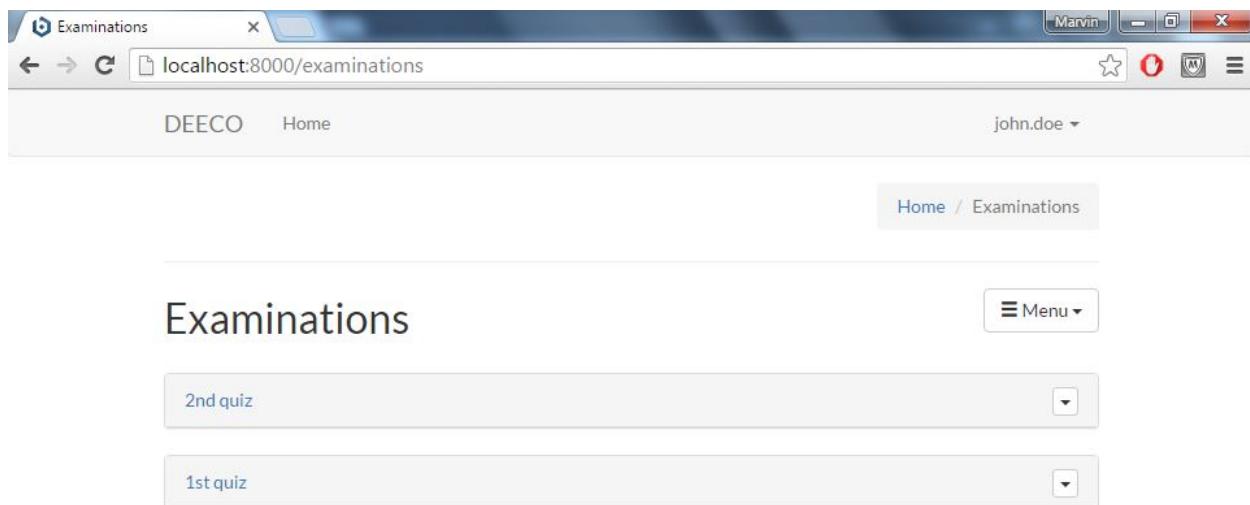

Figure 16: List of examinations available for publishing

The screenshot shows a web browser window with the title bar '1st long test'. The address bar displays 'localhost:8000/examinations/3'. The page content is titled 'DEECO Home' and shows a user 'john.doe'. A breadcrumb navigation path 'Home / Examinations / 1st long test' is visible. On the right, there is a 'Menu' button. The main content area is titled 'Examination details' and contains the following information:

Subcategory:	Quiz
Description:	1st long test
Total points	0
Created at:	2016-06-03 00:07:41

Below this, a message states 'Not attached to any grade section subject yet.'

Figure 17: Showing the details of an examination

The screenshot shows a web browser window with the title bar 'Parts of 1st long test'. The address bar displays 'localhost:8000/examinations/3/part'. The page content is titled 'Parts of 1st long test' and shows a 'Menu' button. The main content area displays two sections: 'Part 1' and 'Part 2'. Each section is a table with the following data:

Question type:	Multiple Choice
Points per item:	1
Current no. of questions:	10
Total no. of questions:	10

Question type:	True or False
Points per item:	1
Current no. of questions:	0
Total no. of questions:	5

Figure 18: Showing parts of an examination

The screenshot shows a web browser window with the URL localhost:8000/examinations/3/parts/8. The page title is "Included questions". The header includes the DEECO logo, a "Home" link, and a user account for "john.doe". The breadcrumb navigation shows: Home / Examinations / 1st long test / Parts / Included questions. Below the navigation, the section title is "Included questions" and the subtitle is "Type of questions: Multiple Choice". There are two tables showing included items:

Category:	Science		
Topic:	Biology		
Subtopic:	Animal biology	Quantity:	5

Category:	Science		
Topic:	Biology		
Subtopic:	Respiratory system	Quantity:	5

Figure 19: Showing the items included in the examination part

The screenshot shows a web browser window with the URL localhost:8000/examinations/3/parts/8/items/create. The page title is "Create new examination part item". The header includes the DEECO logo, a "Home" link, and a user account for "john.doe". The form fields are:

Category	Topic
Science	Biology

Subtopic: Animal biology

Quantity: (Max: 5): 1

Add item **Back**

Figure 20: Adding an item to an examination part

The screenshot shows a web browser window titled "Categories" with the URL "localhost:8000/categories". The page header includes the DEECO logo, a "Home" link, and a user account for "john.doe". A "Back to examinations / All categories" link is visible at the top right. The main content area is titled "Categories" and features a blue button labeled "+ Add a new category". Below this are four expandable categories: "Default Category", "History", "Mathematics", and "Science", each with a dropdown arrow icon.

Figure 21: List of question categories

The screenshot shows a web browser window titled "Science" with the URL "localhost:8000/categories/Science". The page header includes the DEECO logo, a "Home" link, and a user account for "john.doe". A "Back to examinations / All categories / Science" link is visible at the top right. The main content area is titled "Category: Science" and features a blue button labeled "+ Add a new topic". Below this are four expandable topics: "Biology", "Chemistry", "Default Topic", and "Earth Science", each with a dropdown arrow icon.

Figure 22: List of question topics

The screenshot shows a web application interface for managing subtopics under the 'Biology' topic. At the top, the browser title bar reads 'Biology' and the address bar shows 'localhost:8000/categories/Science/topics/Biology'. Below the address bar, a breadcrumb navigation menu includes 'Back to examinations / All categories / Science / Biology'. A blue button on the right says '+ Add a new subtopic'. The main content area displays a list of subtopics in a grid format:

Subtopic
Animal biology
Default Subtopic
Digestive system
Parts of the human body
Respiratory system
The cell

Figure 23: List of question subtopics

The screenshot shows a web application interface for managing questions under the 'Animal biology' subtopic. The browser title bar reads 'Animal biology' and the address bar shows 'localhost:8000/categories/Science/topics/Biology/subtopics/Animal%20biology'. Below the address bar, a breadcrumb navigation menu includes 'Back to examinations / All categories / Science / Biology / Animal biology'. A blue button on the right says '+ Add a new question'. To the right of the question list is a dropdown menu with question types:

- Multiple choice
- True or False
- Fill in the Blanks
- Match Column A & B
- Select from the wordbank

The main content area displays a list of questions in a grid format:

Question Type	Question Text
...	name
...	Rock
...	Earth
...	Energy
...	Mineral
○	Study 1
○	Matter
○	Matter
○	Earth
○	Space
○	Earth
○	Species

Figure 24: List of questions under the selected subtopic

D. Student Pages

A screenshot of a web browser window titled "DEECO Home". The address bar shows "localhost:8000/home". The page content area displays four categories: "Grade 4 Araling Panlipunan", "Grade 4 History", "Grade 4 Mathematics", and "Grade 4 Science". Each category is enclosed in a light gray rectangular box.

Figure 25: Home page of the student upon login

A screenshot of a web browser window titled "Grade 4 Science". The address bar shows "localhost:8000/classes/4". The main content area is titled "Grade 4 Science". It displays a list of assignments and their details:

Assignment	Description	Action
1st quiz	Subcategory: Quiz Total points: 10 Exam start: 2016-06-02 10:41:00 Exam end: 2016-06-03 10:41:00 Published on: 2016-06-02 10:41:00	Check examination status

VI. Discussion

The Dee Hwa Liong Academy Virtual Classroom is an online (although also accessible offline) student and faculty learning portal. The aim of the system is to create a bridge between students and faculty whenever direct confrontation is not applicable. The system also patterns existing learning portals such as Moodle, Genyo, and Blackboard, but is customized to suit the requirements of the client, Dee Hwa Liong Academy.

Like most learning portals already in existence, the system focuses on the faculty-student relationship, particularly when taking examinations. In real life, the faculty would create different kinds of examinations with varying levels of difficulty, as well as different percentages allotted to them when tallying the final grade. The system has implemented the said relationship, as we can see on the system.

The system could act as an online dropbox for both students and faculty. The system would greatly improve dissemination of lectures, syllabus, and other files the faculty would like to share with the class. This would also be a great alternative in requiring submissions from students.

The system would also be able to create examinations for students to answer. The system has achieved its goal of making sure that randomness plays a key part in generation of exams to minimize chances of students cheating on a test. The system has also achieved its goal of recording the scores of students in a given class record, to minimize human error in updating the class record.

VII. Conclusion

The objectives have been implemented in the system, although there had been a lot of changes from the original proposal. This is due to the fact that the developer has to change from using Moodle as its base framework to using Laravel.

The design has also been changed based on what the client has required. Nothing major has been deviated from the original design. The color scheme would also be customized based on the client's requirements.

The functionalities of the system administrator were also dramatically increased. The system administrator would now be able to add data to several tables which are essential especially during enrollment. This is to avoid the original assumption that the system would assume that some other data acquired during enrollment were already present. Adding said functionalities to the system administrator would enable the system to be usable without any external data to back it up.

The functionalities of the school management, although a bit simple, were also implemented. The school management would be able to view statistics of the website, as well as view other academic related data including but not limited to list of examinations the faculty has created, and the list of requirement on a given subject.

The system was most successful in implementing the functionalities of the faculty. The faculty was able to create posts, requirements, and most importantly, examinations. The faculty can also view the answers submitted by the user to double check the validity of their scores. The faculty can also view the requirements that are submitted by the students in each respective class.

Furthermore, the faculty can also contribute to the question bank, where all other faculty members can access the same questions to use in their respective exams.

The process of creating questions was also successfully made, although a few parameters have to be changed to fulfill the requirements of the user. What originally was four types of questions was changed to five types of questions, where the type “Matching Type” was split into two types of question: “Select from the Wordbox” and “Match Column A with Column B”.

The system, which was focused on the implementation of the examinations, was successful in doing so. The questions that would make up the examinations would randomly be selected, to fulfill the requirement of the client that exams would have to be as unique per users as possible, while at the same time having the guarantee that the examinations created are reliable and credible. The examinations were automatically checked and recorded in the subject class record, as originally proposed.

The functionalities of the user were also implemented. They can upload requirements demanded by the faculty, and they can only access the subjects they are enrolled in. They can answer the examinations and their scores would automatically be recorded on the class record of the faculty. The students would also be prevented from changing their uploaded files in the faculty’s requirements as well as their answer for a given examination whenever they exceeded the time limit.

VIII. Recommendations

Since the system only uses five forms of question, it is recommended to future developers who will improve the system to add more question types. Question types involving calculation, like problem solving, can be created, as well as question types that would not be immediately checked by the system but would require the direct interaction with the faculty, like essay types.

Also, since Laravel is used, one can also maximize the other objects that are not used in this project. Laravel has much custom functionality that can be implemented to further customize the system according to the specifications required by the user. Any future developers may also rewrite the way the controllers handle requests and calls other objects like services, middlewares, or models, when the said developer has any plan to expand the system.

Lastly, the developer may also improve on the design of the website. The current developer has not covered much in CSS and form designs, so the future developer may use CSS aside from basic bootstrap. They can also utilize using node.js, which could be very useful in creating custom designs for the website.

XI. Acknowledgement

Starting with the most commonly thanked person in acknowledgements, I would like to thank God. This may seem so ordinary to most people, but to me, this means a lot. If there was anyone who I would like to thank the most, it really is God. God made all of this happen. I was at the point of giving up, yet it was His promise to me, in Jeremiah 29:11, which came through. That promise gave me hope when I felt doomed, strength when I felt weak, and wisdom when I lacked it the most. Thank you so much, Lord.

I would also like to thank my family. This also seems like something ordinary, but I cannot express my gratitude for these people. They provided help in every opportunity they can. They kept me sane when I was close to madness; they gave me hope when I didn't have any. They have kept on trusting me when even I can't trust myself. They saw in me someone who can push through, and that's what I became. To my family, and I know you will be reading this, and you're all probably laughing now because of these cheesy lines, thank you so much for the sacrifices you've endured for me. Know that from the bottom of my heart, I am really grateful.

To my friends who never gave up on me, to all of YOU, thank you. To one of my role models, Kuya Raymond, thank you for putting your trust in me and never giving up on my potential. Thank you for never being annoyed with me even when I don't show up. Thank you for taking time to help me in my struggles.

To my team, to Kuya Josh, Dareen, Lloyd, Kuya Beres, Henry, Mark, Daniel and Daniel, Andre, and Kuya Jeff, thank you guys for your never ending support. I always know I can count on you guys during times of trouble. To my team leader, Kuya Josh. I'm sorry I never made it in

your despedida, and it will be a long time without you my friend, but I'll tell you all about it when I see you again.

To my blockmates, thank you guys for the four years (or should I say five?) that we've had. I know that some of you hated me at some point (and I know you are btw) but please accept my apology. Know that it's the good memories that will stick in my mind, not the bad ones.

To UPM-SONS, I can't even begin on how to say thanks to you guys. I know that there are times when we're not really ourselves, and there are even times when we have very emotional conversations *ahem* *ahem*, but those memories cannot compare to the all the great times we've had. Just a quick rundown of those people, thank you Ivan, Toni, Greame, Ghe, Ronnie, Ate Rudj, Ate Sharyl, Ate Kim, Kuya Robin, Dareen, Alex, Aaron, Michelle, Ate Sha. To those not in here, I still want to thank you.

To my adviser, Sir Baes, thank you for putting up with my incompetence. I know I may not be the best advisee you had, but know that I really did my best, and thank you for putting your faith in me.

To my cousins who somehow had something amazing happen to them this 2016, thank for that pressure you put me. No, seriously, that pressure helped gave me momentum in finishing my SP.

To my laptop, thank you so much for not breaking down when I needed you the most. You may be the most used item I ever had in my life, yet you kept strong for me and didn't crash and broke or something. Just don't scare me like crashing right before I have my SP defense again, cool?

To all others who I've probably forgot to include here, I still want to thank you, and sorry for not putting you here. Maybe next time...
