

I. INTRODUCTION

A. Background of the Study

During the past decade, the issue of post-operative pain management has come under increased scrutiny. A variety of factors have contributed to this situation, including increased patient awareness, advances in technology and increased clinical and regulatory initiatives. In spite of this progress, a significant proportion of patients still do not receive adequate relief of pain following surgery. The management of post-operative pain remains an issue of concern.[1]

In January 2004, it was agreed that pain scoring shall be included in the TPR (temperature/pulse/respiration) sheet of The Medical City (TMC). A series of lectures were conducted by the medical staff of the Pain Clinic. On October 12, 2006, a study was conducted to measure the quality of pain assessment and management of post-operative patients. The study resulted to incompleteness of pain scoring data.[2] Pain assessment and management still remains a problem in spite the efforts of the hospital administration.

In TMC, recording of operative patient's information begins a day or hours before the surgical procedure. Upon admittance, the admission clerk fills up a form containing the patient's personal information and billing details. When the patient is already in the selected unit, the assigned anesthesiologist assesses the patient and fills up a pre-anesthesia form. This form contains the patient's personal information, expected date of surgery, surgical procedures, anesthesia plan and other medical concerns.

During the surgery, the anesthesiologist records the operation data containing the operation procedures, anesthetic technique and medications. The anesthesiologist signs the record together with the anesthesia assistant, a resident or an associate. When the patient is transferred to the recovery room (RR), the RR nurse or the anesthesia assistant encodes the initial post-operative data including the type of anesthesia administered, condition of patient, wound site state and post-operative medications. The anesthesia resident also encodes post-operative data in the anesthesia resident's RR logbook. A logbook for nurses is also available in the RR. In the patient's stay in the RR, the nurses will be responsible for monitoring the

patient's condition, giving the medications prescribed by anesthesiologist, and updating the anesthesiologist about their patient's condition. After minutes, with an average of 4 hours, stay in the RR, an inpatient is transferred to the nursing unit or to the Intensive Care Unit (ICU). Post-operative patient requiring comprehensive and continuous care is observed at the ICU.

Ideally, the nurses should report to the anesthesiologist in a specific interval of time depending on the patient's condition or the anesthesiologist's specification. They should relay the patient's pain score and experiences thought to be related to anesthesia or pain medications (headache, vomiting, itching, difficulty of breathing, etc.) so that medicines can be given or changed. Information about the patient's condition is obtained by asking the patient or by examination of a nurse.

The post-operation monitoring, usually 48-hr monitoring period, is very important in post-operative patients because this is the time to prevent or immediately cure the complications of the procedures or the medication side effects. The monitoring period starts after the surgery. The anesthesiologist and the anesthesia assistant are accountable to the patient until the monitoring is over. If there is no anesthesia assistant present in the operation or when the assigned assistant is unavailable, the case will be passed on to the anesthesia resident-on-duty(AROD).

B. Statement of the Problem

At present, the exchange of information between nurses, anesthesiologists and residents and the collection and recording of data are done manually. Due to inadequate manpower because of migration of medical practitioners, the service offered to post-operative patients is insufficient. There are problems in transmitting information. Most of the time, nurses are too busy to ask the patients' relative data and to relay immediately to the doctors their patient's complains and findings. There are also times when the doctors cannot be contacted.

Keeping track of the patients' location, present condition and the time of monitoring also becomes a problem. This problem occurs mostly when the patients are taken to their units because of the need to transfer voluminous information from RR nurses to unit nurses. Also, due to inefficiency of the manual system, there is a poor data collection and documentation. Retrieval of data is also difficult because of the need to navigate through different patient's charts and forms.

C. Objectives of the Study

General Objective:

To develop a web-based system that will manage and store records of patients who underwent operation with anesthesia in the surgery suite of the 3rd floor of The Medical City and will enable nurses, residents and anesthesiologists to communicate via SMS.

Specific Objectives:

1. to provide a module for nurses that will allow them to perform the following functions
 - a. view and update personal information
 - b. change username and password
 - c. search patient by hospital number and/or name
 - d. add new patient record
 - e. view consultation of assigned under monitoring patients
 - f. update record of assigned patient (personal information, pre-operative data, post-operative data, location, medications, side effects and pain scores)
 - g. read SMS messages containing doctors' orders

2. to provide a module for residents with the following capabilities
 - a. view and update personal information
 - b. change username and password
 - c. search patient by hospital number and/or name
 - d. view consultation of patients
 - e. update record of patient (personal information, post-operative data and medications)
 - f. send and receive messages via SMS of their mobile phones
 - i. send messages to the system containing their orders to nurses
 - ii. receive messages from the system containing patients' concerns
3. to provide a module for anesthesiologists that allows performing the following functions
 - a. view and update personal information
 - b. change username and password
 - c. search patient by hospital number and/or name
 - d. view consultation of consulted patients
 - e. update record of consulted patient (medications and monitoring details)
 - f. send and receive messages via SMS of their mobile phones
 - i. send messages to the system containing their orders to nurses
 - ii. receive messages from the system containing their patients' concerns
4. to provide a maintenance system that allows the system administrator to
 - a. manage users
 - i. search user by type, system id and/or name
 - ii. add new user
 - iii. view user information
 - iv. update user's personal information and account settings
 - v. archive user
 - b. manage nurse assignments
 - i. add, edit and delete assignment schedule
 - ii. add, edit and delete nurse in assignment schedule
 - iii. add edit and delete room in assignment schedule
 - c. manage locations
 - i. view floors
 - ii. add, edit and archive rooms

- iii. add edit and archive beds
- d. manage system data
 - i. view post-operation report
 - iii. update AROD's cellular phone number

D. Significance of the Study

With the development of the Post-operative Pain Management System with SMS, the storage, retrieval and processing of data will be improved. Electronic communication may help doctors to respond immediately to their patients' needs. The incorporation of the Short Message Service (SMS) of mobile phones can help the nurses to inform the anesthesia assistants and anesthesiologists about the patients' condition. The notification system will allow the doctors to be instantly informed of significant events. It can also help the doctors to give immediate orders for their patients wherever they are.

The electronic registry of the post-operative patients will help the nurses in easy monitoring. The records of the patients' personal information, their operations, given interventions, effect of interventions and pain management, can be accessed easily. The reports that will be provided by the system will offer an alternative for the resident's and nurse's RR logbooks. The quality, accuracy and completeness of the data that will be encoded into the system is still highly dependent on its users but it will allow faster and more efficient way of transmitting information in order to improve quality of care for patients.

E. Scope and Limitations

1. The proposed system will only keep track of the anesthetized post-operative inpatients from the 3rd floor surgery suite of The Medical City.
2. The system is limited to post-anesthetic concerns only. More elaborate details on patient's concerns will have to be channelled accordingly.
3. The proposed system will not be responsible in recording patients' data after the monitoring period.
4. Addition of floors of the hospital is outside the system's concern.

5. Post-operative patients transferred to the ICU will not be monitored by the system.
6. Charging of text messages will be out of the system.

F. Assumptions

1. Nurses are able to check the system regularly to update the records whenever necessary.
2. Doctors respond immediately to the patients' concerns.
3. When a valid user updates a record it is because the record is erroneous and not because of personal interest.
4. Nurse assignments follow that of the hospital.
5. Signed prescription letters of the medications ordered through the system are provided by the doctors.

II. REVIEW OF RELATED LITERATURE

A computer-based surgical services management system for communicating between sites of a surgical services facility was developed by David Strum and Luis Vargas. The system includes a number of unique features. These features include scheduling, data analysis, telephone communications, report writer and data-achieve analyzer. The management system is responsible for tracking, recording, and communicating patient movement between site locations of a surgical services facility.[3]

James Menke et al in the research article, "Computerized clinical documentation system in the pediatric intensive care unit", implemented and evaluated

computerized clinical documentation system (CDS). Before and after implementation of CDS, a time study involving nursing care, medication delivery, and normalization of serum calcium and potassium values was performed. In addition, an evaluation of completeness of documentation and a clinician survey of shift to shift reporting were also completed. After the evaluation, the researchers claimed that the CDS provided a more legible, complete, and accessible patient record compared to a paper chart without affecting time spent in direct patient care. The availability of the CDS improved shift to shift reporting. Other observations showed that the CDS improved management capabilities; helped physicians deliver care; improved reimbursement; limited data entry errors and reduced costs.[4]

A fully interfaced clinical information system (CIS) contains physiologic, laboratory, blood gas, medication and other data that can be used as the information base for a comprehensive alerting system. CareVue CIS, a C++ software system developed by Michael Shabot et al, was used in 64 beds in seven ICUs to test its efficacy. Bedside data is obtained with data links to physiologic monitors, ventilators, electronic urimeters and intravenous infusion pumps. Medication orders and administration information is obtained from the CareVue Medication Administration Record (MAR). The system contains a rules engine for detecting critical events and an alerting engine to notify appropriate caregivers via multi-line alphanumeric pagers. When an alert condition is detected, the alerting engine formats a message and transmits it to the pagers of various recipients based on a table of recipients per message type and patient service type. After months of implementation the authors concluded that the use of computerized detection of critical medication-related events was more effective than manual detection and reporting.[5]

Prior attempts to interface ICU Clinical Information Systems (CIS) to Pharmacy systems have been less than successful. The major problem is that in ICUs, medications frequently have to be administered and charted in the CIS Medication Administration Record (MAR) before pharmacists can enter them into the Pharmacy system. When the Pharmacy system belatedly sends medication orders to the CIS MAR, this may create duplicate entries for medications that ICU nurses have had to enter manually to chart doses actually given. To solve this problem, Patient Care Expert (PCX) was developed and interfaced to a CIS serving 133 beds in 10 ICUs at Cedars-Sinai Medical Center. PCX is a real time interface between a Computerized Physician Order Entry (CPOE) system and a CIS. It was interfaced to the hospital's Pharmacy system and medication orders for ICU patients were transmitted to the CIS

MAR. As soon as a physician authenticated orders with an electronic signature, all medication orders appeared in the CIS MAR. Once the nurses authenticated the new medication entries, nurses may chart individual doses. During the three months of operation, the interface eliminated manual order transcription, medication entry errors and improved ICU nurse efficiency and satisfaction.[6]

In 1996, the Chief Information Office introduced Veterans Health Information Systems and Technology Architecture (VistA®). It is a rich, automated environment that supports day-to-day operations at United States' Department of Veterans Affairs (VA) health care facilities.[7] The real flagship of VistA® is the VA Computerized Patient Record System (CPRS).[8] CPRS capabilities include a Real-Time Order Checking System, a Notification System to alert clinicians to clinically significant events, and a Clinical Reminder System. It is flexible enough to be implemented in a wide variety of settings and is used by a broad spectrum of healthcare providers.[9]

Computerized reminders are proven effective in outpatient settings but have not been proved to increase preventive care in inpatient settings. To determine the effects of computerized reminders on the rates at which preventive therapies were ordered for inpatients, Paul Dexter et al conducted a randomized trial. During an 18-month study period, a computerized system processed on-line information for all 6371 patients admitted to a general medicine service (for a total of 10,065 hospitalizations), generating preventive care reminders as appropriate. Physicians who were in the intervention group viewed these reminders when they were using a computerized order-entry system for inpatients. Computerized reminders significantly increased the rate of delivery of preventive therapies.[10]

Hsiao-Ting Chen et al designed and implemented a real-time clinical alerting system for ICU, which executes alert algorithms on the database records of ICU physiologic parameters. The system automatically detects the physiological status of the patient. If the status conforms to the alert rule definitions, the system sends related messages to the clinicians via pagers or mobile phones. The data source invoked in this system is from the CareMaster™ CIS used in a 14-bed Surgical ICU at Taipei Veterans General Hospital. In a questionnaire taken by the 30 medical staff, 95% of the staff agreed that using mobile communication tools to inform them is a great help when the patient is in critical condition.[11]

A study conducted by Linda Dawson et al entitled “Investigating The Potential Improvement of Patient Management Systems In Hospital Ward Settings Using Mobile, Wireless Technologies” aims to present an action research study to monitor the utility, user acceptance, security and safety of wireless Information Communication Technology (ICT) devices and applications at the bedside for patient management and to analyse the current clinical ICT environment and work practices in a typical acute ward settings. The implications of the research are that current ICT environments in clinical wards may not be being fully utilised to enhance patient management at point of care due to barriers to usability and accessibility both to appropriate technology and consequently appropriate information needed for high-level, high quality patient management. There are also implications that the introduction of mobile, wireless technologies may deliver anticipated improvements in patient care as long as security and usability issues can be addressed.[12]

The “Evaluation of Clinical Response To Wireless Technology” by Charlotte Seckman et al is a study to investigate the safety, use and response of clinical staff to wireless technology. A convenience sample of clinical staff was surveyed using a variety of assessment tools. Survey results indicated a high level of acceptance for the wireless technology related to perceived usefulness, perceived ease of use, impact, adoption, advantage and future need. [13]

A randomised controlled trial was conducted by M Salim Silva et al in 1999 to assess the effectiveness of a telephone reminder in increasing responses to postal surveys. The trial was carried out with two separate Australian female samples. Sample A comprised 200 current office workers at an Australian university. Sample B consisted of patients who had developed work related neck and upper limb disorders between January 1980 and November 1984. A questionnaire about work related neck and upper body disorders were sent to them. A reminder letter, another copy of the questionnaire and a final letter were sent at two week intervals. Half of the non-respondents within each sample were randomly selected to receive a telephone reminder just after the second mailout of the questionnaire. Among 143 non-respondents, the responses were significantly higher among those who received the telephone reminder intervention.[14]

III. CONCEPTUAL/THEORETICAL FRAMEWORK

A. The Medical City (TMC)

The Medical City (TMC) is a private, tertiary care located along Ortigas Avenue in Pasig City. It has been operational since 1967. Its structure is composed of two towers joined by a Podium and bridge ways. The 15-storey Nursing Tower is currently fitted for 500 beds, and a future second Nursing Tower provides capacity for an additional 300 beds. Within the 6-floor Podium are located diagnostic and intervention facilities, as well as support and administrative offices.[15]

TMC offers diagnostic and treat services that address a broad range of diseases utilizing state-of-the-art technology such as computed tomography, magnetic resonance imaging and cardiac catheterization and interventional services among others. This is made possible through the Clinical Departments (including their various subspecialties) of Medicine, Surgery, Anesthesiology, Pediatrics, Obstetric-Gynecology, Ophthalmology, Otolaryngology, Psychiatry and Rehabilitation Medicine, as well as diagnostic and intervention units such as Clinical laboratories, Diagnostic

Radiology and Radiotherapy, Nuclear Medicine, Acute Stroke Unit and Intensive Care Unit. [15]

B. Clinical Information System (CIS)

A clinical information system is a computer-based system that is dedicated to the collection, storage, manipulation, and presentation of all the clinical information important to delivery of patient care. It is a collection of various information technology applications that provides a centralized repository of information related to patient care across distributed locations. This repository represents the patient's history of illnesses and interactions with providers by encoding knowledge capable of helping clinicians decide about the patient's condition, treatment options, and wellness activities. The repository also encodes the status of decisions, actions underway for those decisions, and relevant information that can help in performing those actions. The database could also hold other information about the patient, including genetic, environmental, and social contexts.[16]

CIS not only automates and streamlines many of the processes used by healthcare providers, but provides an extremely useful and usable electronic patient chart. The electronic patient record has all the flexibility of the traditional patient chart and all the advantages of electronic information flow. The care provider can update, browse, and share the information on the chart, and use it for outcome analysis, as well as integrate the information into the electronic systems for billing, filling prescription, lab tests, referrals, etc.[17]

C. Short Message Service (SMS)

The Short Message Service (SMS), also called text messaging, mobile messaging, or alphanumeric paging is a means of sending short messages to and from mobile phones.[18] It lets users send short text and numeric messages to and from digital cell phones, cell phones and e-mail addresses, as well as cell phones and public SMS messaging gateways on the Internet.[19] Originally, a single short message can be up to 160 characters of text in length. Those 160 characters can comprise of words or numbers or an alphanumeric combination. Non-text based short messages are also supported. These are used for ringtones and logos services for

instance.[20] The service makes use of a Service Centre, which acts as a store and forward centre for short messages.[19] The SMS Center handles and manages short messages. In case a problem in transmission occurs, the short message is stored and resent.

D. GAMMU (GNU All Mobile Management Utilities) SMS Manager

Gammu, earlier (up to version 0.58) named MyGnokii2, is a project which encompasses applications, scripts and drivers for managing various functions on cellular phones and similar devices.[20] It supports a wide variety of Nokia, Symbian, and AT devices (Siemens, Alcatel, Falcom, WaveCom, IPAQ, Samsung, SE, and others) over cables, infrared, or Bluetooth. It contains libraries with functions for ringtones, phonebook, SMS, logos, WAP, date/time, alarm, calls, and more (used by external applications like Wammu). It also includes a command line utility that can make many things (including backups) and an SMS gateway with full MySQL and PostgreSQL support from the PHP interface.[21]

It is a stable and mature codebase available on the market and provides functions unavailable in other similar projects. Long term development is oriented towards making a shared API for classes of device rather than supporting single phone models (which are eventually made obsolete with the arrival of new models). [21]

E. Task Scheduler

The Task Scheduler enables the user to automatically perform routine tasks on a chosen computer. The Task Scheduler does this by monitoring whatever criteria the user chooses to initiate the tasks (referred to as triggers) and then executing the tasks when the criteria is met.[22] VisualCron is an automation tool and scheduler for Windows. Advanced file/script execution, file transfer (FTP/FTPS/SFTP/SSH), email, archiving (ZIP/TAR/GZIP), encryption (PGP), system control (Hibernate,Standby,Restart,Logoff), SQL execution and monitoring are standard functions of VisualCron.[23]

F. Definition of Terms [24]

1. Ambulatory surgery- surgery performed on a person who is admitted to and discharged from a hospital on the same day
2. American Society of Anesthesiologists (ASA) score – five category physical status classification system for assessing a patient before surgery: normal healthy patient, patient with mild systemic disease, patient with severe systemic disease, patient with severe systemic disease that is a constant threat to life, moribund patient who is not expected to survive without the operation, declared brain-dead patient whose organs are being removed for donor purposes. If the surgery is an emergency, the physical status score is followed by “E”.
3. Anesthesia – a drug, administered for medical or surgical purposes, that induces partial or total loss of sensation and may be topical, local, regional, or general, depending on the method of administration and area of the body affected
4. Anesthesiologist – a medical doctor trained to administer anesthesia and manage patients medically before, during, and after surgery
5. Intensive Care Unit (ICU) - a specialized section of a hospital that provides comprehensive and continuous care for persons who are critically ill and who can benefit from treatment
6. Mallampati score – also Mallampati classification, is used to predict the ease of intubation. It is determined by looking at the anatomy of the oral cavity; specifically, it is based on the visibility of the base of uvula, faucial pillars and soft palate.
7. Obstetric surgery – refers to procedures that are performed to treat a variety of conditions affecting the female reproductive organs. The main structures of the reproductive system are the vagina, the uterus, the ovaries, and the fallopian tubes.
8. Pain management – encompasses pharmacological, nonpharmacological, and other approaches to prevent, reduce, or stop pain sensations
9. Pain score – also pain scale, are tools that can help health care providers diagnose or measure a patient's pain's intensity. The most widely used scales are visual, verbal, numerical or some combination of all three forms.
10. Recovery Room (RR) – also called a post-anesthesia care unit (PACU), is a space a patient is taken to after surgery to safely regain consciousness from anesthesia and receive appropriate post-operative care

11. Resident – a physician receiving specialized clinical training in a hospital, usually after completing an internship

IV. DESIGN AND IMPLEMENTATION

A. Entity Relationship Diagram

Figure 1 shows the Entity Relationship Diagram (ERD). There are 22 entities. The attributes of these entities are described in the data dictionary.

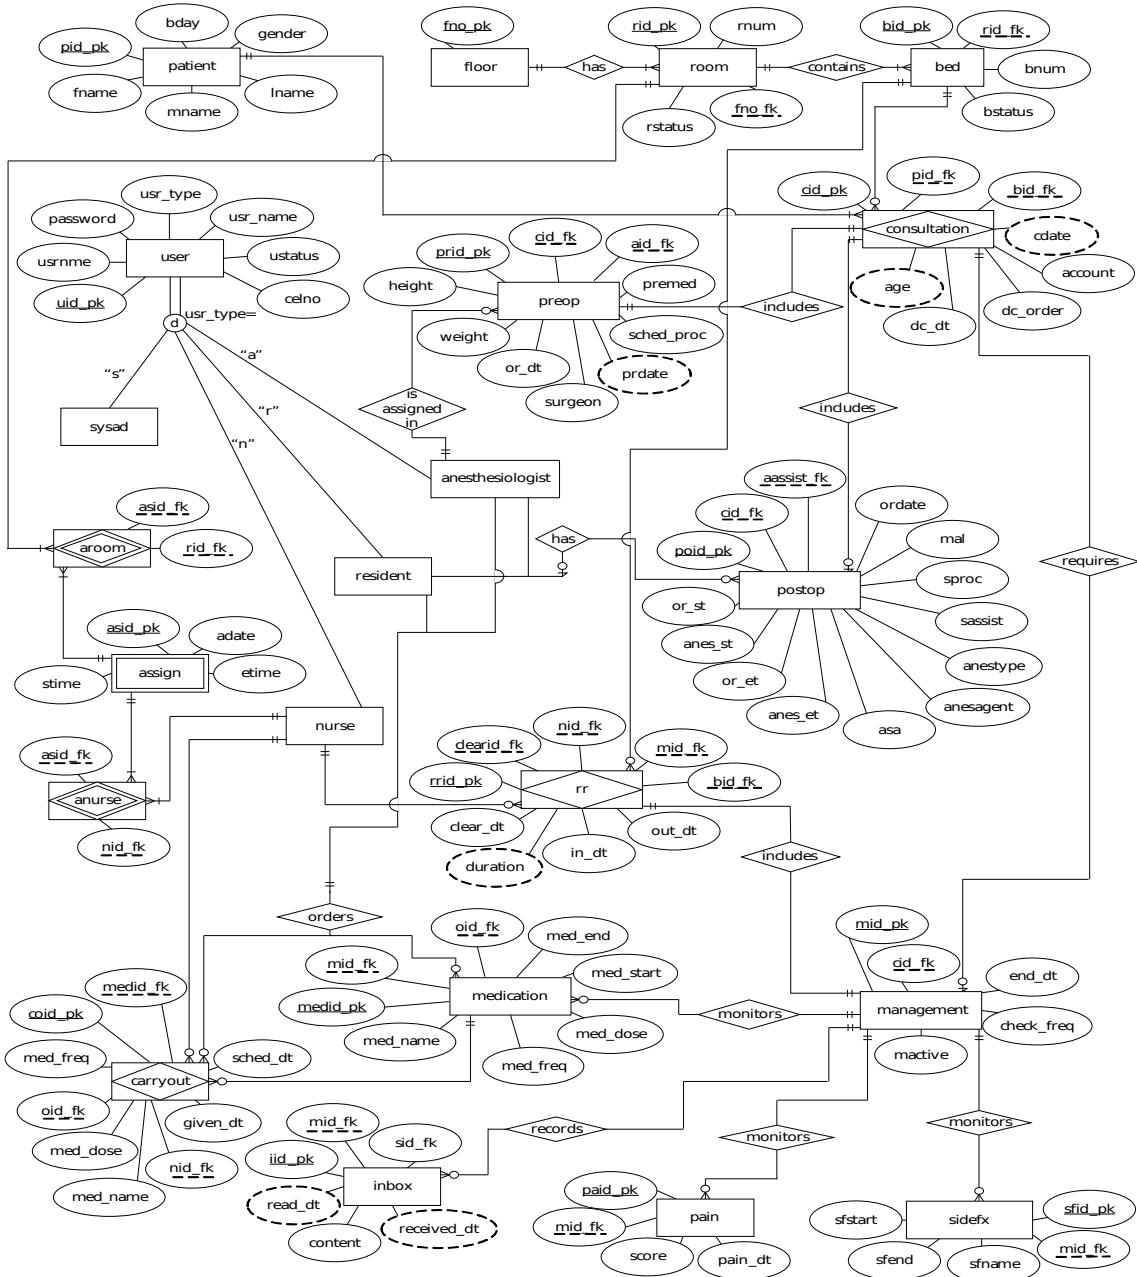

Figure 1: Entity Relationship Diagram, POPMS

B. Data Dictionary

1. user - table listing of nurses, anesthesiologists, residents and system administrators

Attribute	Description	Data Type	Allow Null
uid_pk	PK; user's auto-numbered ID	Int(4)	No
usrnme	UNIQUE; user's log-in username	Varchar(25)	No

password	User's password for authentication	Varchar(25)	No
usr_name	User's full name	Varchar(40)	No
celno	User's cellular phone number	Varchar(13)	Yes
usr_type	Type of user; Value: 's' for system administrator, 'a' for anesthesiologist, 'r' for resident, 'n' for nurse	Char(1)	No
ustatus	Status of the user's account; Value: 0 for deactivated, 1 for active, 2 for archived	Tinyint(1)	No

2. patient – table listing of anesthesia department's patients

Attribute	Description	Data Type	Allow Null
pid_pk	PK; patient's ID or hospital number	Int(6)	No
fname	Patient's first name	Varchar(20)	No
mname	Patient's middle name	Varchar(20)	Yes
lname	Patient's surname	Varchar(20)	No
bday	Patient's date of birth	Date	No
gender	Patient's gender; Value: 1 for male, 2 for female	Char(1)	No

3. floor – table listing of hospital floors

Attribute	Description	Data Type	Allow Null
fno_pk	PK; floor number	Int(2)	No

4. room – table listing of hospital rooms

Attribute	Description	Data Type	Allow Null
rid_pk	PK; room's auto-numbered ID	Int(3)	No
fno_fk	FK; floor where the room belongs	Int(2)	No
rnum	room number	Varchar(6)	No
rstatus	Flag that determines whether the room is archived	Tinyint(1)	No

5. bed – table listing of hospital beds

Attribute	Description	Data Type	Allow Null
bid_pk	PK; bed's auto-numbered ID	Int(4)	No

rid_fk	FK; ID of the room which contains the bed	Int(3)	No
bnum	PK; bed number	Varchar(8)	No
bstatus	Flag that determines whether the bed is archived	Tinyint(1)	No

6. consultation – table listing of admission records

Attribute	Description	Data Type	Allow Null
cid_pk	PK; consultation ID or record number	Int(8)	No
pid_fk	FK; ID or hospital number of the admitted patient	Int(6)	No
bid_fk	FK; ID of the bed of the admitted patient	Int(4)	No
cdate	DERIVED; Consultation date (based on computer date)	Date	No
account	Health card of admitted patient	Varchar(20)	Yes
age	DERIVED; patient's age (based on patient's birth date)	Int(3)	No
dc_order	Full name of the doctor who discharged the patient	Varchar(40)	Yes
dc_dt	Date and time the patient is discharged	Timestamp	Yes

7. preop – table listing of pre-operative records

Attribute	Description	Data Type	Allow Null
prid_pk	PK; auto-numbered ID identifying a pre-operative record	Int(8)	No
cid_fk	FK; consultation ID of the pre-operative patient	Int(8)	No
aid_fk	FK; ID of the anesthesiologist of the surgery	Int(4)	No
prdate	DERIVED; Pre-operative assessment date (based on computer date)	Date	No
weight	Patient's weight in pounds	Int(3)	Yes
height	Patient's height in centimeters	Int(3)	Yes
or_dt	Scheduled date and time of surgery	Timestamp	No
surgeon	Full name of surgeons of the operation	Text	No
sched_proc	Scheduled surgical procedures of patient	Text	No
premed	Pre-anesthesia medications given to the patient	Text	Yes

8. postop – table listing of post-operative records

Attribute	Description	Data Type	Allow Null
poid_pk	PK; auto-numbered ID identifying a post-operative record	Int(8)	No
cid_fk	FK; consultation ID of the post-operative patient	Int(8)	No
aassist_fk	FK; ID of the anesthesia assistant present in the operation	Int(4)	Yes
ordate	Date of surgery	Date	No
sassist	Full name of surgical assistant present in the operation	Text	Yes
sproc	Surgical procedures done to the patient	Text	No
mal	Mallampati score; Value: 1 for I, 2 for II, 3 for III, 4 for IV	Char(1)	Yes
asa	American Society of Anesthesiologist score; Value: 1-6 ±E	Varchar(2)	Yes
anestype	Type of anesthesia administered to patient	Text	No
anesagent	Anesthesia agent given to patient	Varchar(5 0)	No
or_st	Time the surgical procedure started	Time	No
or_et	Time the surgical procedure ended	Time	No
anes_st	Start time of anesthesia	Time	No
anes_et	End time of anesthesia	Time	No

9. management - table listing of post-anesthesia management records

Attribute	Description	Data Type	Allow Null
mid_pk	PK; auto-numbered ID identifying a post-anesthesia management record	Int(8)	No
cid_fk	FK; consultation ID of the patient under monitoring	Int(8)	No
check_freq	Time frequency of checking the patient's condition	Time	No
end_dt	Date and time when to stop monitoring	Timestamp	No
mactive	Flag which determines whether the patient is still under monitoring	Tinyint(1)	No

10. rr - table listing of records containing details about the post-operative patient's stay in the RR

Attribute	Description	Data Type	Allow Null
<u>rrid_pk</u>	PK; auto-numbered ID identifying a RR record	Int(8)	No
mid_fk	FK; ID of post-anesthesia management record of patient under recovery	Int(8)	No
nid_fk	FK; ID of the nurse-in-charge in the RR	Int(4)	Yes
clearid_fk	FK; ID of the anesthesiologist or resident who cleared the patient	Int(4)	Yes
bid_fk	FK; RR bed number occupied by the patient	Int(4)	No
clear_dt	Date and time the patient is cleared	Timestamp	Yes
in_dt	Date and time when the patient was transferred to the RR	Timestamp	No
out_dt	Date and time when the patient was transferred to the nursing unit	Timestamp	Yes
duration	DERIVED; length of patient's stay in the RR (difference of in_dt and out_dt)	Time	Yes

11. medication - table listing of ordered medications

Attribute	Description	Data Type	Allow Null
<u>medid_pk</u>	PK; auto-numbered ID identifying an ordered medication	Int(10)	No
mid_fk	FK; ID of post-anesthesia management record of patient under medication	Int(8)	No
oid_fk	FK; ID of the anesthesiologist or resident who ordered the medication	Int(4)	No
med_name	Drug name	Varchar(25)	No
med_dose	Dosage of the drug	Text	No
med_freq	Frequency of drug intake	Time	No
med_start	Scheduled date and time when to start the medication intake	Timestamp	No
med_end	Flag which determines if the medication has ended	Tinyint(1)	No

12. carryout - table listing of carried out medication schedules

Attribute	Description	Data Type	Allow Null
coid_pk	PK; auto-numbered ID of carried out medication schedule	Int(10)	No
nid_fk	FK; ID of the nurse who gave the medicine to the patient	Int(4)	No
medid_fk	FK; ID of the medication received by the patient	Int(10)	No
oid_fk	FK; ID of the anesthesiologist or resident who ordered the medication	Int(4)	No
med_name	Drug name	Varchar(25)	No
med_dose	Dosage of the drug	Text	No
sched_dt	DERIVED; Scheduled date and time of the medication intake (start of medication or last time the medication was given plus frequency of intake)	Timestamp	No
given_dt	Date and time the medicine was given	Timestamp	No

13. pain – table listing of pain score records

Attribute	Description	Data Type	Allow Null
paid_pk	PK; auto-numbered ID of patient's pain score record	Int(10)	No
mid_fk	FK; ID of post-anesthesia management record of the patient	Int(8)	No
score	Patient's pain score	Int(2)	No
pain_dt	Timestamp of pain score entry	Timestamp	No

14. sidefx – table listing of patients' side effects associated with anesthesia or post-anesthesia management medications

Attribute	Description	Data Type	Allow Null
sfid_pk	PK; auto-numbered ID identifying anesthesia or medications side effects	Int(10)	No
mid_fk	FK; ID of post-anesthesia management record of complaining patient	Int(8)	No
sfname	Side effect	Varchar(20)	No
sfstart	Date and time the side effect started	Timestamp	No
sfend	Date and time the side effect was resolved	Timestamp	Yes

15. assign - table listing of nurse assignment schedules

Attribute	Description	Data Type	Allow Null
asid_pk	PK; auto-numbered assignment schedule ID	Int(5)	No
adate	Assignment schedule date	Date	No
stime	Start time of assignment schedule	Time	No
etime	End time of assignment schedule	Time	No

16. anurse - table listing of nurses assigned in schedule

Attribute	Description	Data Type	Allow Null
asid_fk	FK; nurse assignment schedule ID	Int(5)	No
nid_fk	FK; ID of the assigned nurse	Int(4)	No

17. aroom - table listing of rooms assigned to nurses in schedule

Attribute	Description	Data Type	Allow Null
asid_fk	PK; nurse assignment schedule ID	Int(5)	No
rid_fk	FK; ID of the room assigned to the nurses	Int(3)	No

18. inbox - table listing of valid text messages

Attribute	Description	Data Type	Allow Null
iid_pk	PK; auto-numbered message ID	Int(10)	No
mid_fk	FK; Patient's post-anesthesia management record ID where the message is directed	Int(8)	No
sid_fk	Cellular phone number of the sender of the message (anesthesiologist or resident)	Varchar(13)	No

C. Context Diagram

The context diagram in Figure 2, illustrated below, shows that the system has four main types of users: nurse, anesthesiologist, resident and system administrator or the quality assurance staff. Two databases are used in managing the system. The GAMMU database facilitates the sending and receiving of SMS messages. The POPMS database stores system data and controls other system functions.

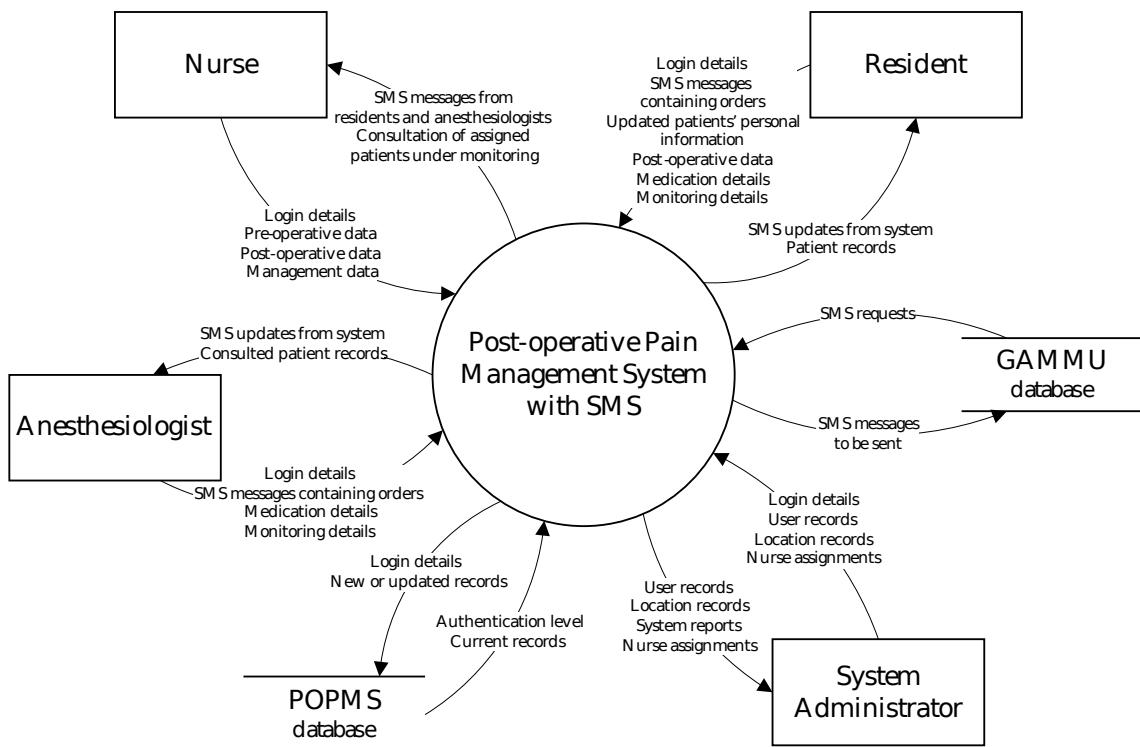

Figure 2: Context Diagram, POPMS

D. Data Flow Diagram

Figure 3 shows the system's top level data flow diagram. The system would implement thirteen main functions. These are: (1) Login, (2) Search patient, (3) Add patient record, (4) View patients, (5) Update patient, (6) Manage pain scores, (7) Manage medications, (8) Manage side effects, (9) Manage locations, (10) Manage users, (11) Manage assignment schedules, (12) View reports, and (13) Manage SMS messages.

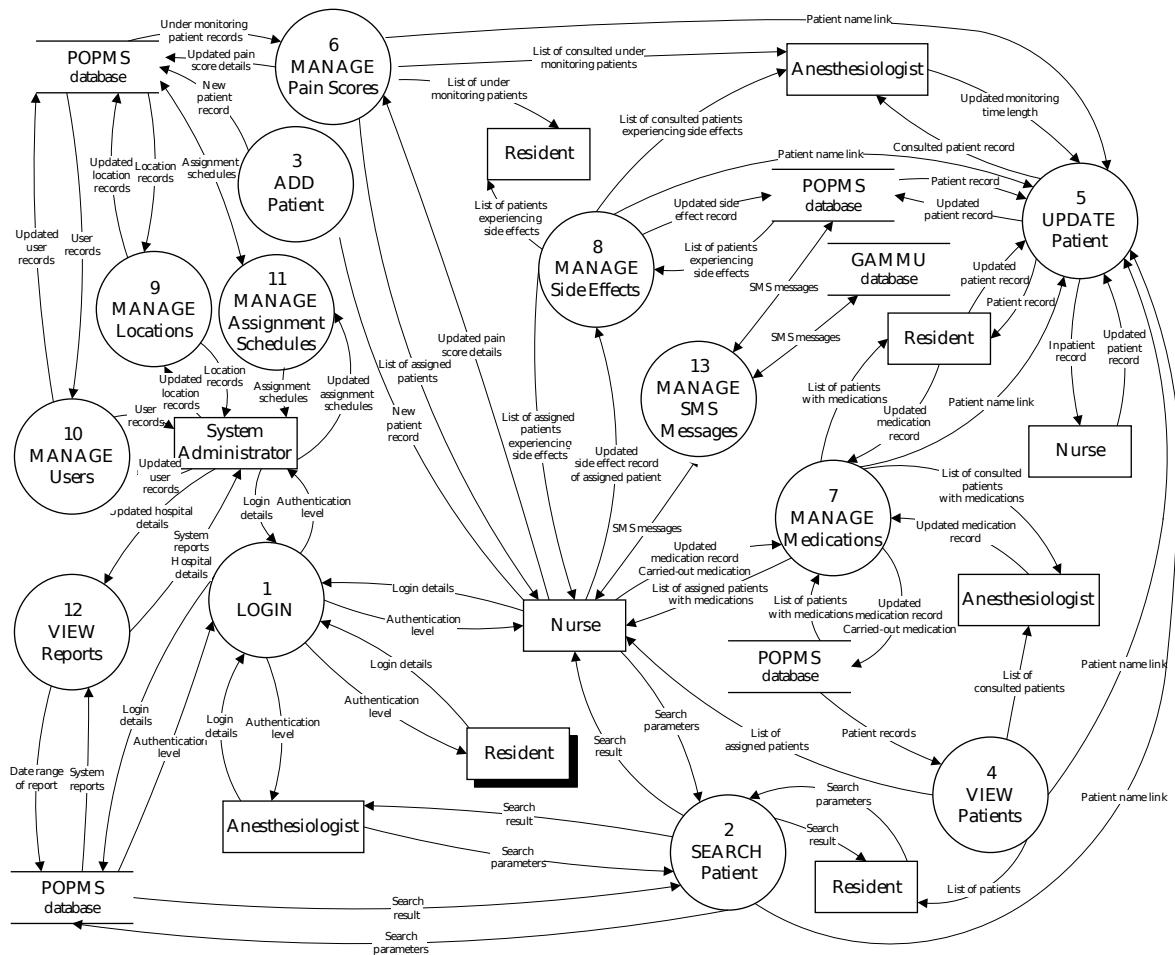

Figure 3. Top Level Data Flow Diagram, POPMS

Figure 4 shows the sub-explosion of Process 1: LOGIN. All users need to gain different levels of access to avail of the system's functionalities. The username and password inputted by the users will be confirmed by the system. Upon successful login, the user can update his personal information, username and password.

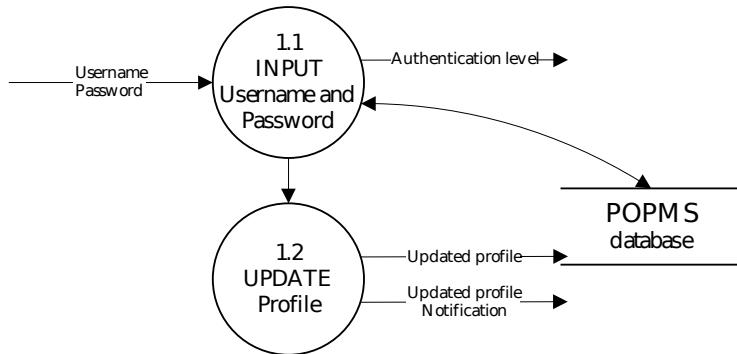

Figure 4. Sub-explosion of Process 1: Login, POPMS

The sub-explosion of Process 2: Search Patient is seen in Figure 5. All anesthesiologists, residents and nurses can use the search function to easily view a patient record. However, the patients that will be displayed after the search will depend on the users' access rights. Nurses can view and update only the records of under monitoring patients assigned to them. Anesthesiologists can view present and past records of patients consulted to them. They can update only the records of inpatients consulted to them. On the other hand, a resident can view all patient records and update records of inpatients.

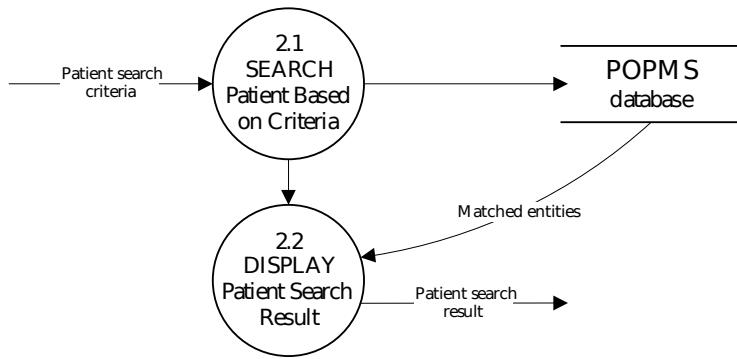

Figure 5. Sub-explosion of Process 2: Search Patient, POPMS

Figure 6 illustrates the sub-explosion of Process 4: View Patients. Process 4.1: View Patients by Location allows a valid user to see the list of patients in the selected location. On the other hand, the other sub-process Process 4.2 View Patients by Status gives a valid user a choice of viewing patients consulted to them (only for anesthesiologists), without post-operation data yet (for RR nurses and residents only), inpatients that already went through the monitoring period and past patient records. These options are shown in Figure 7: Sub-explosion of Process 4.2: View Patients by Status.

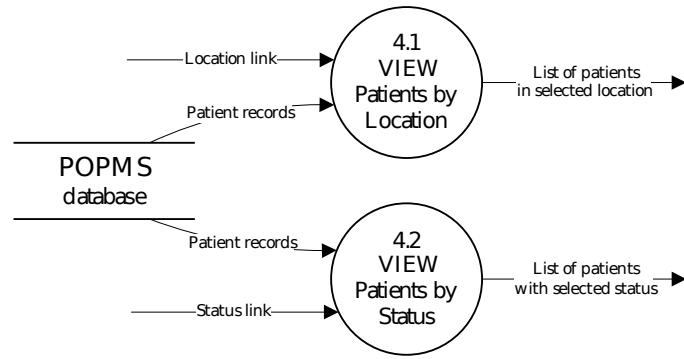

Figure 6. Sub-explosion of Process 4: View Patients, POPMS

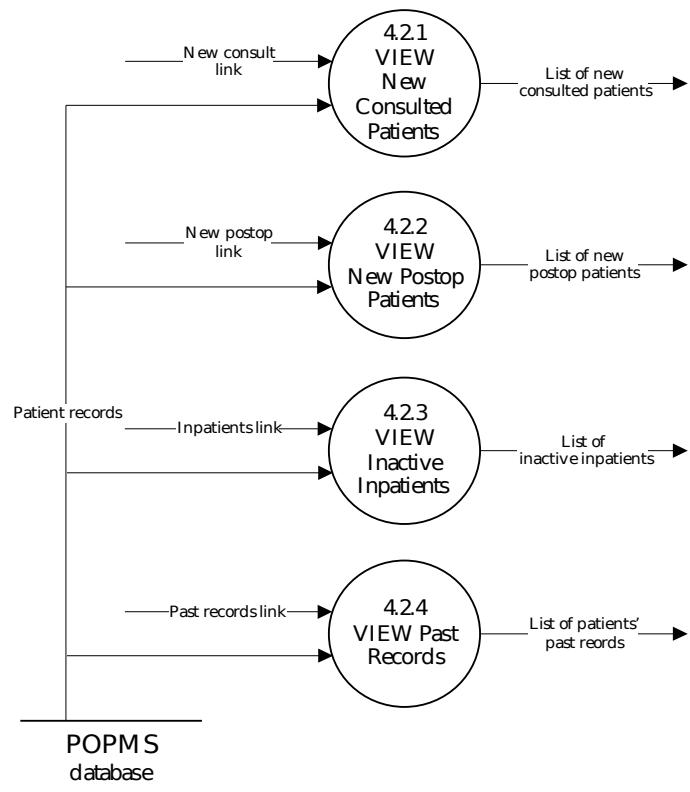

Figure 7. Sub-explosion of Process 4.2: View Patients by Status, POPMS

After viewing a patient record, a valid user can update the record. The sub-explosion of Process 5: Update Patient is illustrated in Figure 8. Patient data that can be edited includes personal information, pre-operation data, post-operation data, RR stay data, and discharge details. These functions are only available for consultations of an inpatient. Past consultation records of patients can only be viewed.

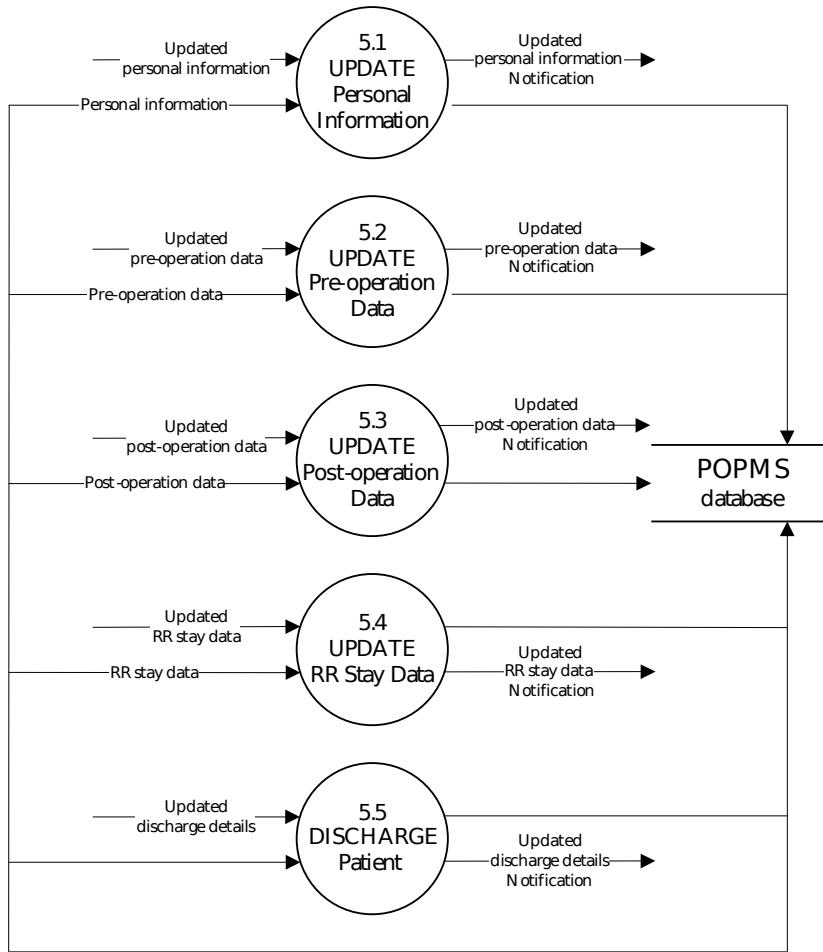

Figure 8. Sub-explosion of Process 5: Update Patient, POPMS

New post operation record can be added if there is no such record for a consultation. Editing of this record, as well as pre operation record, can be done in existing records. The sub-process of updating pre and post operation records are depicted in Figure 9, sub-explosion of Process 5.2: Update Pre-operation Data, and Figure 10, sub-explosion of Process 5.3: Update Post-operation Data.

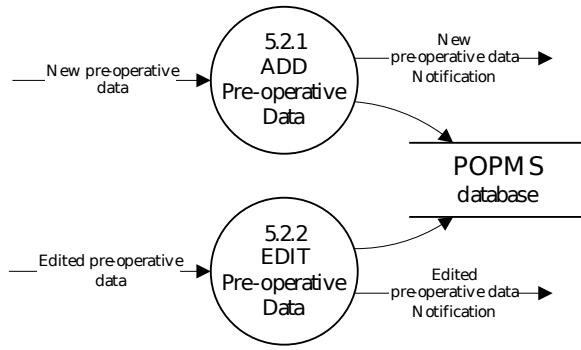

Figure 9. Sub-explosion of Process 5.2: Update Pre-operation Data, POPMS

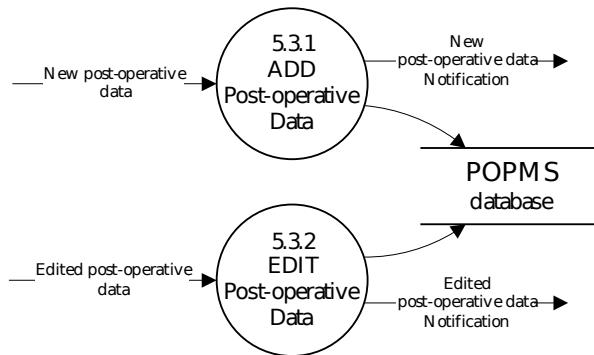

Figure 10. Sub-explosion of Process 5.3: Update Post-operation Data, POPMS

Figure 11 depicts the sub-explosion of Process 5.4: Update RR Stay Data. If the RR stay data for a consultation is not available, the anesthesia assistant, anesthesia resident or anaesthesiologist, of the operation or the RR nurse can add the data.

When a patient is cleared from the RR, the patient is ready for transfer to the nursing unit.

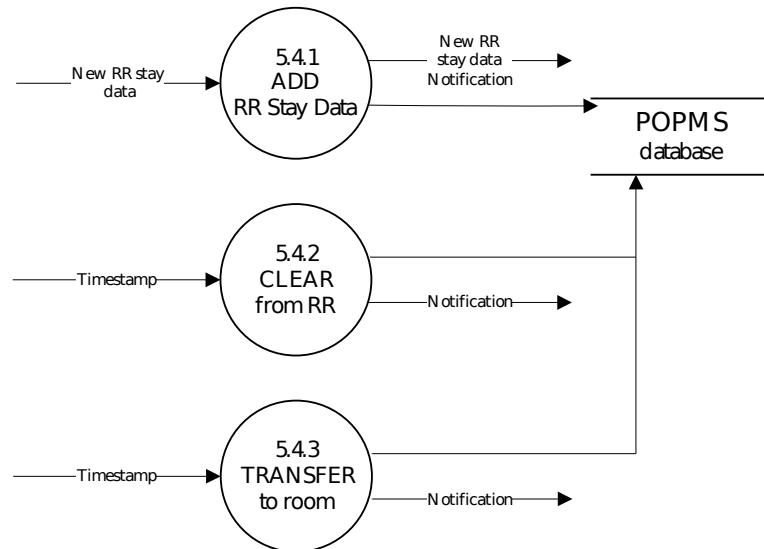

Figure 11. Sub-explosion of Process 5.4: Update RR Stay Data, POPMS

Process 6: Manage Pain Scores allows valid user to view and update the pain scores of patients under monitoring. Its sub-explosion is shown in Figure 12. Sub-explosion of Process 6: Manage Pain Scores. Only the nurses can update the pain score of patients.

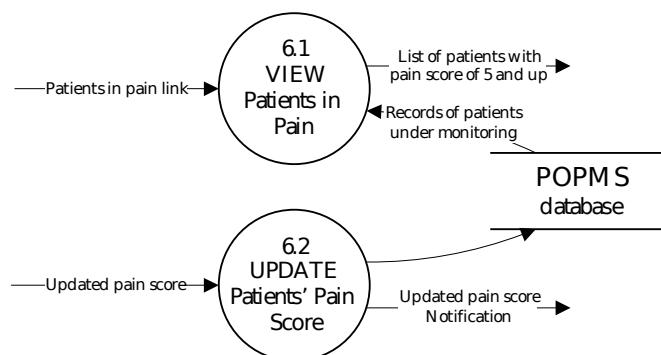

Figure 12. Sub-explosion of Process 6: Manage Pain Scores, POPMS

For easy monitoring of patients, a valid user can view the list of patients with medications and those with reported side effects. The list of patients with medications are arranged in ascending order of remaining time until the administration of medicine while the list of patients with side effects are arranged chronologically based on the time the side effect was reported. Figure 13 shows the

sub-explosion of Process 7: Manage Medications and the sub-explosion of Process 8: Manage Side Effects is illustrated in Figure 14.

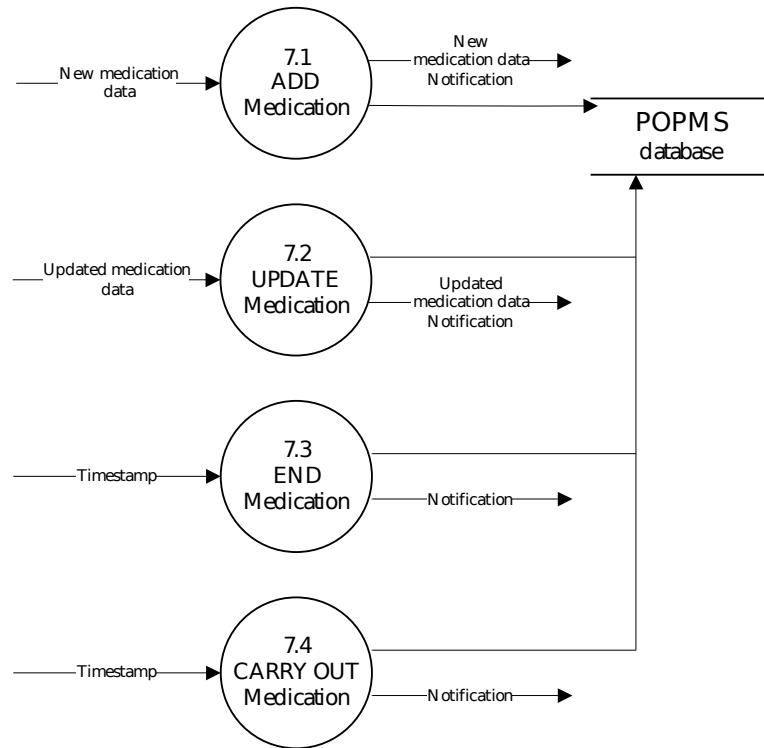

Figure 13. Sub-explosion of Process 7: Manage Medications, POPMS

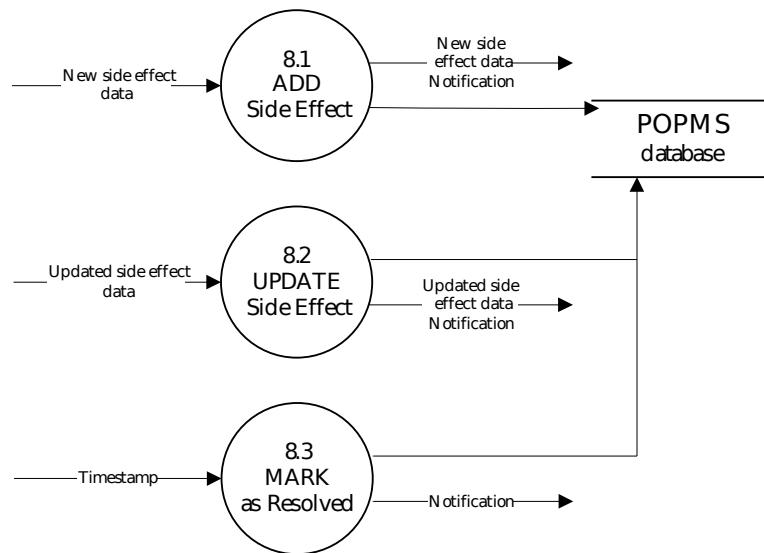

Figure 14. Sub-explosion of Process 8: Manage Side Effects, POPMS

The sub-explosion of Process 9: Manage Locations is illustrated in Figure 15. The system administrator can update the rooms and beds stored in the system database so that the data will be the same as the hospital's locations. The sub-explosions of Process 9.2: Manage Rooms and Process 9.3: Manage Beds are depicted in Figures 16 and 17.

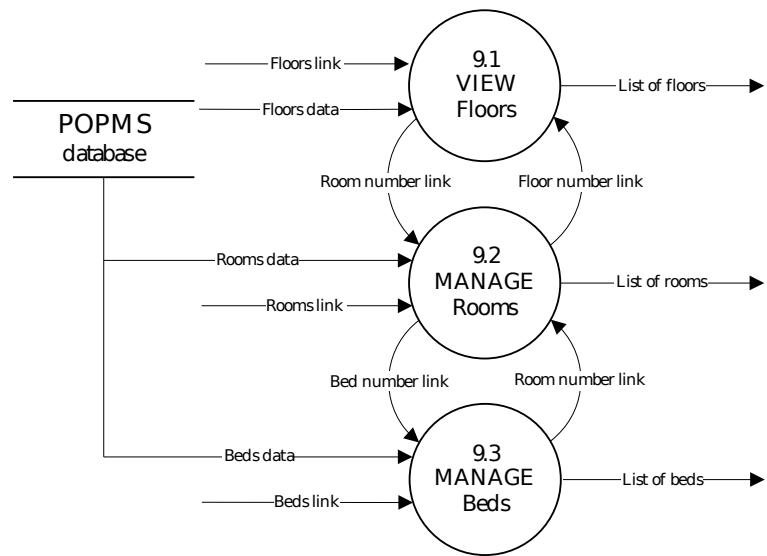

Figure 15. Sub-explosion of Process 9: Manage Locations, POPMS

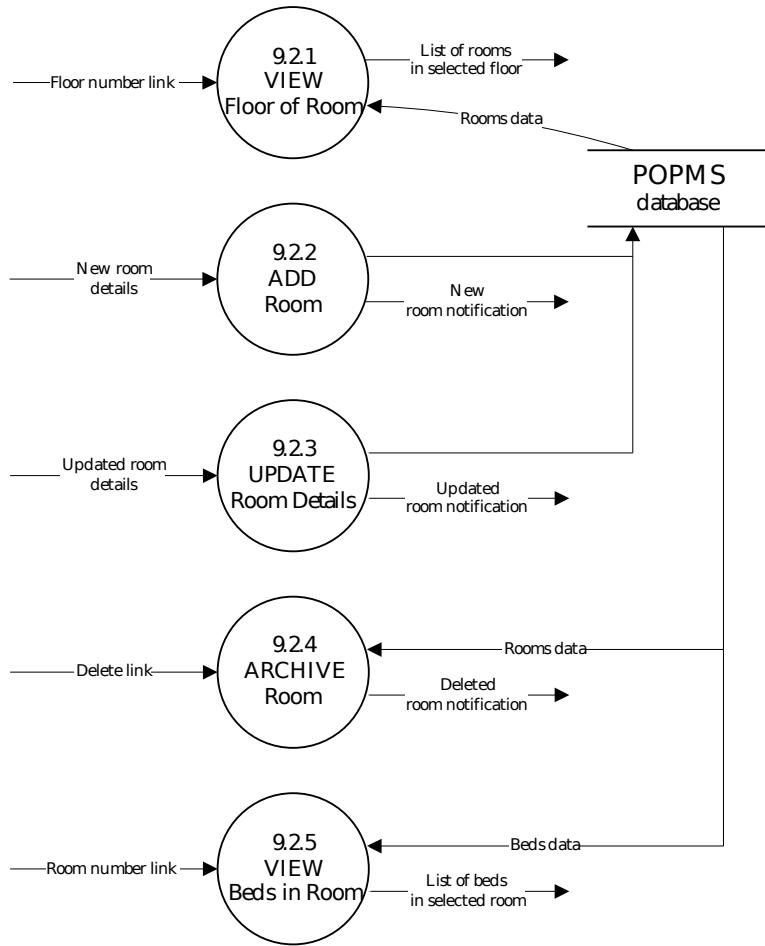

Figure 16. Sub-explosion of Process 9.2: Manage Rooms, POPMS

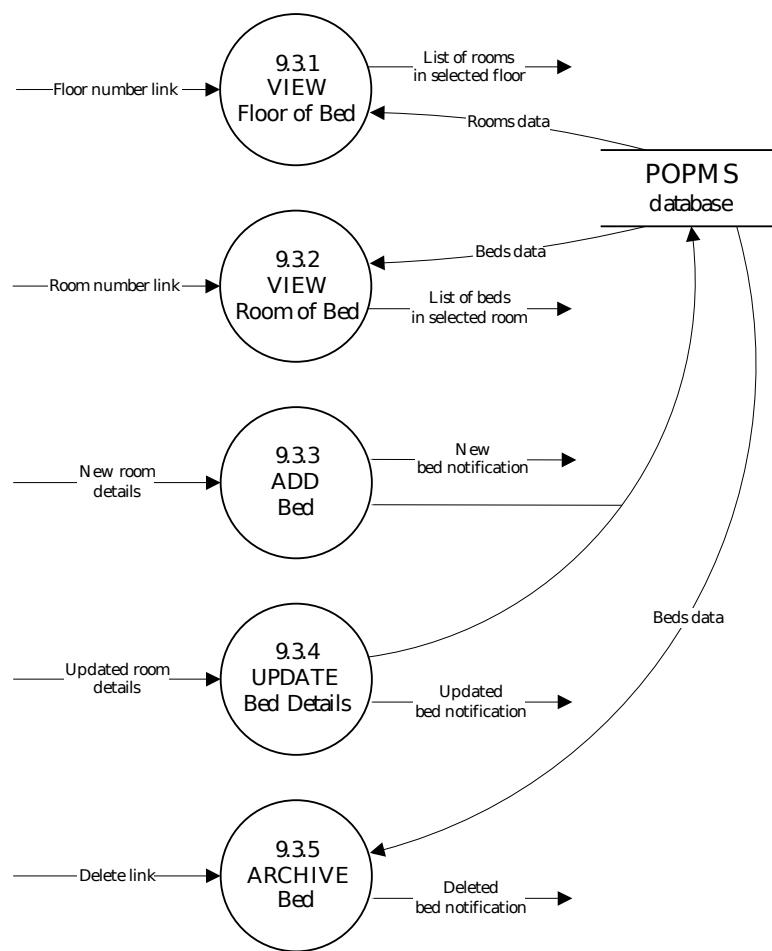

Figure 17. Sub-explosion of Process 9.3: Manage Beds, POPMS

Figure 18 shows the sub-explosion of Process 10: Manage User. This process allows the system administrator to search a user, add new user, update existing user

profile, activate or deactivate an account and archive a user. The sub-explosion of the Process 10.1: Search User is can be seen in Figure 19. The administrator can search by user type, user id and/or user name.

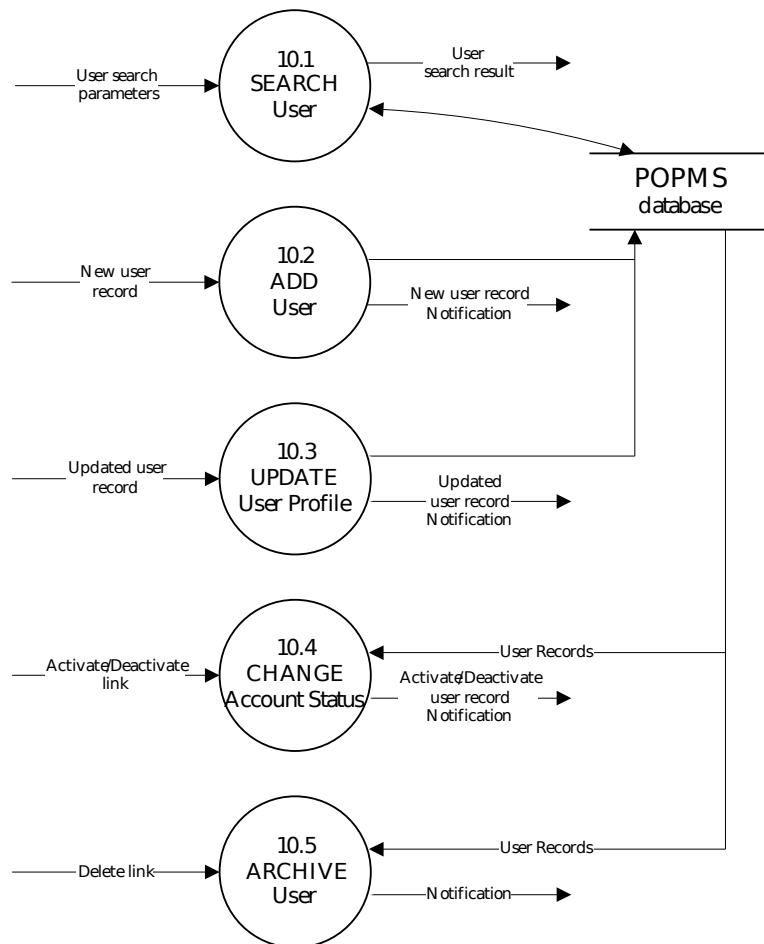

Figure 18. Sub-explosion of Process 10: Manage Users, POPMS

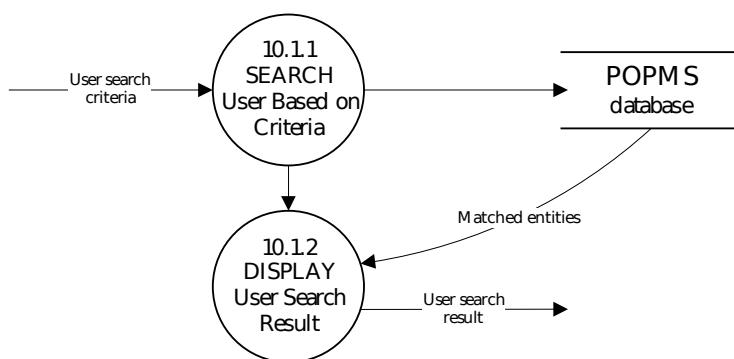

Figure 19. Sub-explosion of Process 10.1: Search User, POPMS

To filter the patient records that can be viewed and updated by the nurses, the system administrator can set an assignment schedule for them. Figure 20 shows the sub-explosion of Process 11: Manage Assignment Schedules.

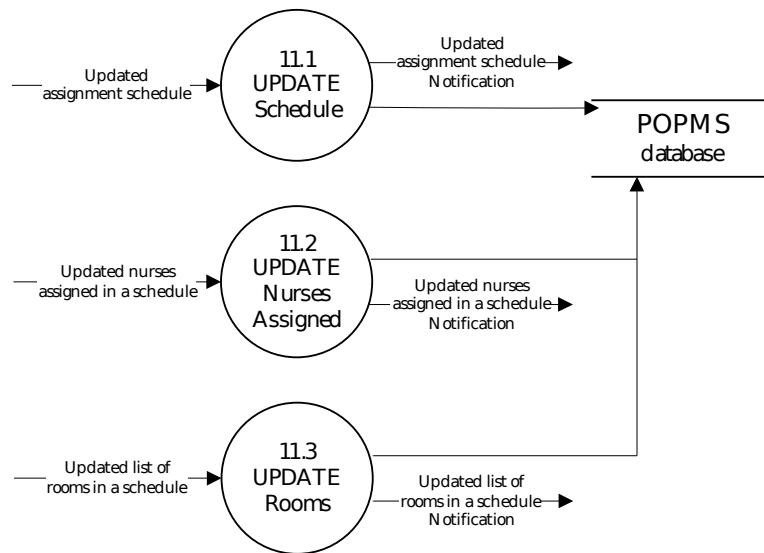

Figure 20. Sub-explosion of Process 11: Manage Assignment Schedules, POPMS

Important post-operation hospital reports can be seen by the system administrator. These includes the data in the anesthesia resident's RR logbook and data in the RR nurse's logbook. The resident's logbook is represented by the post-operation report while the RR report corresponds to the nurse's logbook. The RR report is grouped per shift (6am-2pm, 2pm-10pm, 10pm-6am) based on the time the patient was transferred from the RR. To limit the record that will be displayed, the system administrator can input the desired date range of report. Reports can also be viewed and saved as Microsoft Excel documents. These sub-processes are depicted in the sub-explosions of Process 12.1: VIEW Post-operation Report and Process 12.2: VIEW RR Report illustrated in Figures 22 and 23, respectively.

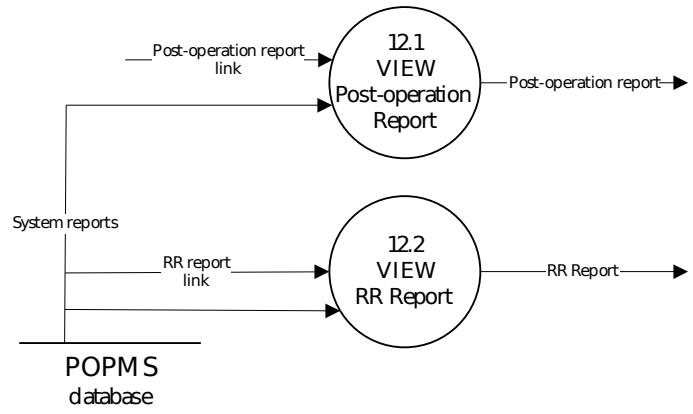

Figure 21. Sub-explosion of Process 12: View Reports, POPMS

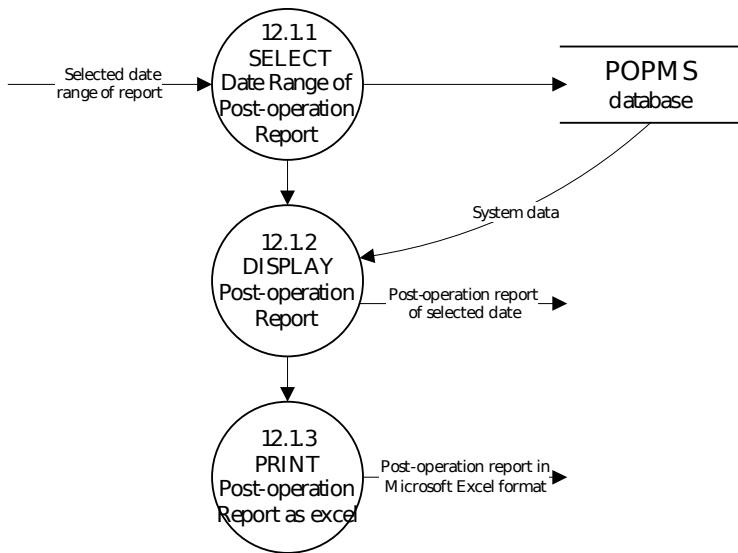

Figure 22. Sub-explosion of Process 12.1: View Post-operation Report, POPMS

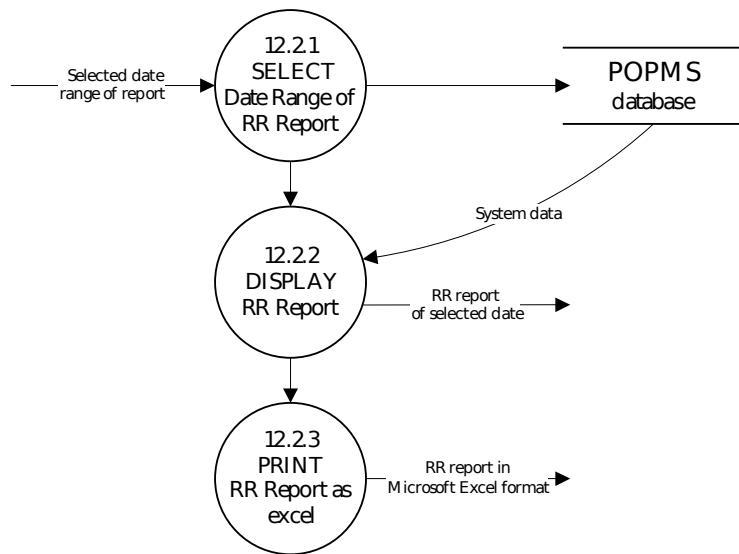

Figure 23. Sub-explosion of Process 12.2: View RR Report, POPMS

Figure 24 illustrates the sub-explosion of Process 13: Manage SMS Messages. Nurses can read the SMS messages containing orders from anesthesiologists and residents. The system will also schedule sending of messages to users.

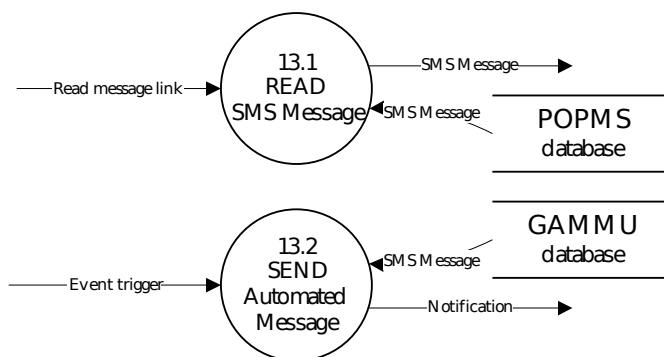

Figure 24. Sub-explosion of Process 13: Manage SMS Messages, POPMS

A flowchart is provided to show how the system processes SMS messages. The flowchart is illustrated in Figure 25. Scheduling of sending SMS messages are done when the system is triggered – a new SMS message is received, a new side effect is inputted or a pain score is added or updated.

When a message is received, the system checks if the message is in the correct format. If the message format is invalid, the system checks if the cellular phone number used is registered in the system database. Only registered users will be able to receive a notification message informing the sender that the message is invalid. If the received message follows the order message format, it will be further examined. The system confirms if the username, password and management id provided by the sender is valid. If the message is valid, the system will cancel the scheduled task (SMS messages that will be sent in case the responsible contact was not able to respond on time) and store the message in the database for the nurse to read. The sender of a valid message will be notified by the system. The side effect and pain score records that are stored in the database are analyzed by the system. The system automatically notifies the person in-charge when a side effect is reported and when the pain score reported is 5 and up. Tasks are also scheduled.

When a significant event in the patient happened, the first person to be notified is the anesthesiologist. The system will check first if the cellular phone number of the anesthesiologist is available. The message will be sent every 5 minutes if the anesthesiologist didn't reply or the patient record is not updated. If after 3 times of sending the message and still the anesthesiologist didn't respond, the message containing the patient's concern will be sent to the anesthesia assistant. If there is no anesthesia assistant cellular phone number available, the system will direct the text message to the anesthesia resident on-duty cellular phone number. All messages to anesthesia assistants will be redirected to the AROD cellular phone number from 5pm to 8am. Only doctors who provided their cellular phone number will be able to receive notifications from the system.

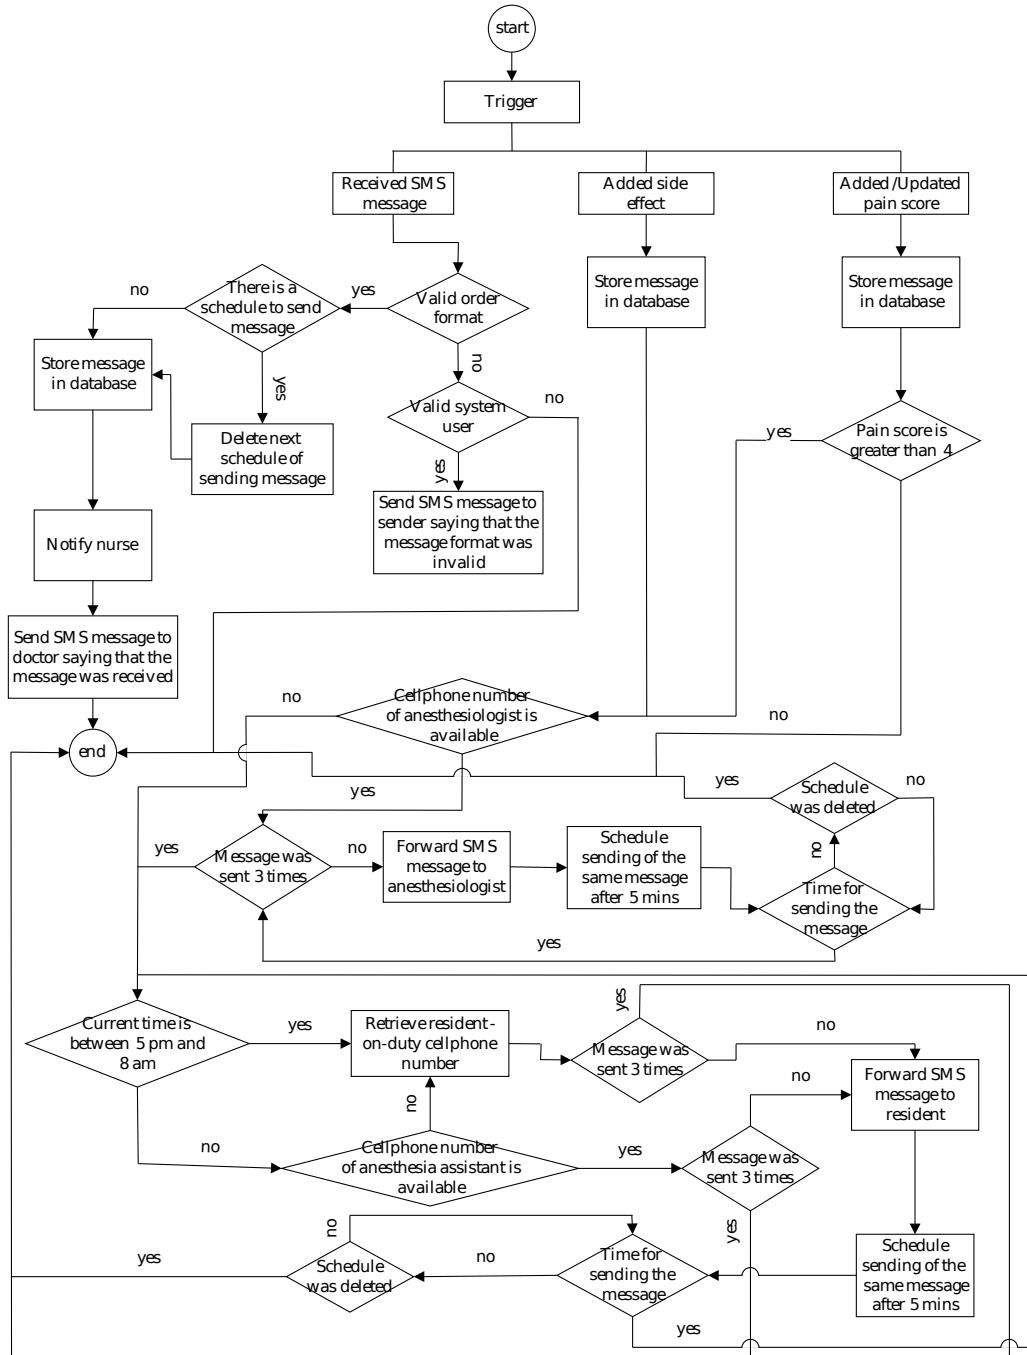

Figure 25. Flowchart for sending SMS messages, POPMS

E. Data Retrieval and Collection

System's Short Message Service are available to anesthesiologists and residents. They will be notified by the system via SMS if a significant event happened to their patients and they can send their orders to the nurses by using this service. If they didn't provide their cellular phone number, they can view their patient's condition and update information by logging in the system and viewing their patients' records. System administrators and nurses will be provided with their corresponding functionalities upon logging in the system.

1. SMS Format

Format of order from anaesthesiologist or resident:

OR [mid_pk] [order] u:[username] p:[password]

Example:

OR 12345678 Diazepam 6mg every 4hrs u:cvgbayot p:mypass123

System Interpretation: An order from user cvgbayot with password mypass123 for patient with management ID of 12345678. The message between the management ID and username is for the nurse to interpret.

2. Grammatical Rules

Received SMS messages are parsed by the system to check its validity. Only valid text messages will be processed by the system.

Rules for valid text messages:

```
<message> ::= "OR" <space> <mid_pk> <space> <text> <space>
              u:<username> <space> p:<password>
<mid_pk> ::= <digit> <digit> <digit> <digit> <digit> <digit>
              <digit>
<username> ::= <word>
<password> ::= <word>
<word> ::= ( <letter> | <digit> ) { <letter> | <digit> }
<text> ::= <char>{<char>}
<char> ::= <letter> | <digit> | <space>
<letter> ::= 'A' | 'B' | 'C' |...| 'Z' | 'a' | 'b' | 'c' |...| 'z'
<digit> ::= 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9
```

<space> ::= ''

F. Technical Architecture

The Post-operative Pain Management System is a web-based clinical information system that uses client-server architecture. (see Figure 26). Under the structure of the client-server architecture, a computer network will have a server computer, which functions as the "brains" of the organization, and a group of client computers, which are commonly called workstations.[25] In this scenario, the client represents the users who access the system.

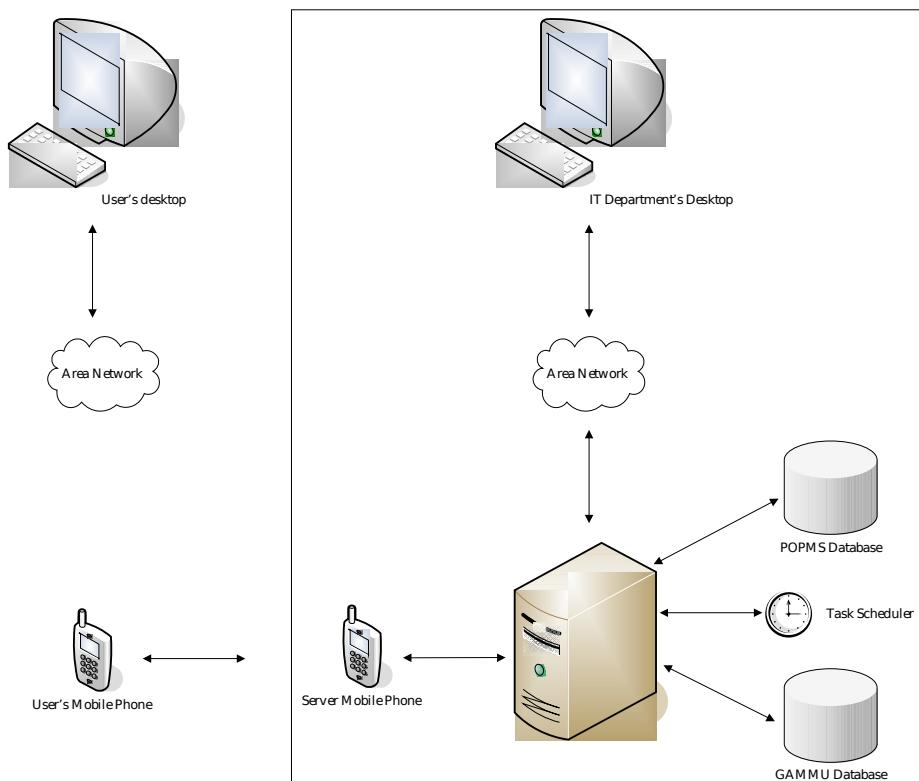

Figure 26. Technical Architecture of POPMS

Technical Specifications

The machine to be used in the system should have the following specifications:

Hardware

- 1 GHz processor or faster
- At least 256 MB of RAM

- 10 GB available hard disk space or bigger
- 1028 x 768 screen resolution
- Nokia cellular phone compatible with the infrared port

Software

- Microsoft Windows XP or later versions of Windows operating system
- Internet Explorer 6 or equivalent
- GAMMU SMS manager version 1.09.00 or later
- MySQL 5.0.27 or later
- PHP version 5.2.1 or later
- Apache HTTP Server 2.2.4 or later
- VisualCron 4.8.4 or later

V. RESULTS

The login page of POPMS is shown in Figure 27. This page allows users to login to POPMS. There are four types of users that can access the system – nurse, resident, anesthesiologist and system administrator.

Figure 27. Login Page, POPMS

Figure 28. Nurse's Home Page, POPMS

The four types of users have different home pages. The home pages provide some quick links, as shown in Figures 28 - 31, for easy navigation. Figure 28 shows the home page of a RR nurse. A unit nurse doesn't have the New Postop Patients list.

CLEAR PATIENT

Figure 40. Edit Recovery Room Details, POPMS

Patients in the RR can be cleared by the RR nurses or the residents. Figure 41 shows the page for clearing a patient from RR. The default time cleared is current time and the default name who cleared the patient is the anesthesia assistant. After

clearing from RR, the transfer option will be available. The Transfer Patient from Recovery Room page is shown in Figure 42. The defaults time out is the current time.

The screenshot shows the POPMS interface for managing patients in the Recovery Room. At the top, there's a logo for 'THE MEDICAL CITY' and the 'POPMS' system. The main header includes links for 'Patient Search', 'HOME', 'MY ACCOUNT', 'PATIENTS' STATUS', 'PATIENTS' LOCATION', 'MONITORING DATA', 'LOGOUT', and the current time '11:18:59 am'. Below this, a section titled 'RECOVERY ROOM DETAILS' displays patient details: HOSPITAL NO: 33, RECORD NO: 45, and PATIENT NAME: MARY ANN LANSANG. To the right of these details is a 'RR STAY INFORMATION' form with fields for Date (2007-10-26), RR Bed (RR1), Time In (11 : 16 AM), Cleared By (Catalan G), and Time Cleared (11 : 16 AM). Below the form are three buttons: 'save', 'reset', and 'cancel'. At the bottom of the page, a copyright notice reads 'Copyright © 2008, UP Manila. All Rights Reserved.'

Figure 41. Clear Patient from Recovery Room, POPMS

This screenshot is similar to Figure 41, showing the POPMS interface for managing patients in the Recovery Room. The layout and patient details are identical. The 'RR STAY INFORMATION' form shows different time entries: Time In is set to 11 : 16 AM, and Time Cleared is set to 11 : 16 AM. The other fields (Date, RR Bed, Cleared By) remain the same as in Figure 41. The footer copyright notice is also present.

Figure 42. Transfer Patient from Recovery Room, POPMS

Under monitoring patients can be viewed by the nurses and doctors. The page shown in Figure 43 can be accessed using the submenu links of Patient's Location menu in the header. Submenu includes RR link and hospital floors links. Submenu for nurses only shows locations assigned to them. The list can be sorted by management id, patient name, bed number, anesthesiologist name, anesthesia assistant and end

date of monitoring. If the monitoring end date is less than 24 hours, the data displayed under monitoring end will be a countdown from current date to monitoring end date. If the monitoring end date is overdue, the date and time displayed will be in bold font. The records of patients displayed will only be limited to 25 records per page. The previous and next records can be viewed by using the previous or next links. The full lists of complications, medications and pain scores of patients can be viewed by clicking the links corresponding to these data. Users can also stop monitoring the patient using this page.

The screenshot shows the POPMS software interface. At the top, there is a logo for 'University of the Philippines' and a 'Patient Search' button. To the right is the 'POPMs' logo with four colored circles (red, yellow, green, blue) above the text 'Post-operative Pain Management System'. Below the logo is a navigation bar with links: HOME, MY ACCOUNT, PATIENTS' STATUS, PATIENTS' LOCATION, MONITORING DATA, LOGOUT, and the current date and time (1514 pm). A green header bar reads 'UNDER MONITORING PATIENTS IN RR'. Below this is a table listing five patients:

MID	Patient Name	Bed No	Anesthesiologist	Assistant	Complications	Medications	Pain Score	Monitoring End	Action
40	PACHECO, Elizabeth	RR2	Ancheta C	None	vomiting	Phenegran(25mg)	7	Oct 28, 9:00 am	Stop Monitor
47	RAMBOYONG, Raul	RR7	Catalan G	Ponciano P			0	Oct 28, 10:00 am	Stop Monitor
46	QUIMPO, Vicente	RR6	Balcueva E	Balcueva S			0	Oct 28, 10:00 am	Stop Monitor
44	PIEDAD, Fernando Basilio	RR4	Banzon J	Acosta D			7	Oct 28, 10:00 am	Stop Monitor
48	RAMOS, Eugenio Jose	RR8	Banzon J	None			0	Oct 28, 10:00 am	Stop Monitor

At the bottom of the table, there are links for 'Patients 1-5 of 5', 'Previous', and 'Next'. The footer of the page includes the copyright notice 'Copyright © 2008, UP Manila. All Rights Reserved.'

Figure 43. List of Under Monitoring Patients in a Location, POPMS

For easy monitoring of patients, lists of patients based on important monitoring data are made available. Patients with current pain score greater than 4 will be listed in the In Pain Patients list, as shown in Figure 44. Figures 45 and 46 show patients with medications and those with unresolved complaints, respectively. These lists can be sorted by clicking the tables' header and records are limited to 25 records per page only.

The screenshot shows the POPMS (Post-operative Pain Management System) interface. At the top, there's a logo for the University of the Philippines and a search bar labeled "Patient Search". Below the search bar is a navigation menu with links for HOME, MY ACCOUNT, PATIENTS' STATUS, PATIENTS' LOCATION, MONITORING DATA, LOGOUT, and the current time (2:27:34 pm). A green banner at the top says "IN PAIN PATIENTS". The main content area displays a table of patient information:

Patient Name	Bed No	Pain Score	Date and Time	Anesthesiologist	Assistant	Action
PACHECO, Elizabeth	RR2	7	Apr 1, 12:22 AM	Ancheta C	None	Edit Medication
PICAZO, Eugenio	N1216	5	Oct 26, 10:00 AM	Catalan G	Ancheta C	Edit Medication
PIEDAD, Fernando Basilio	RR4	7	Oct 26, 10:00 AM	Banzon J	Acosta D	Edit Medication

Figure 46. Complaining Patients List, POPMS

Page for adding and editing of the patient's pain score is shown in Figure 47. When a pain score is to be added, the default date and time is the current timestamp based on computer date. Clicking the patient's name will direct the user to the consultation details of the patient.

The screenshot shows the POPMS (Post-operative Pain Management System) interface. At the top, there are three main sections: 'Patient Search' (with a logo of the University of the Philippines), 'SMS Messages' (listing MID, Sender, Received, and Message), and a navigation bar with links for HOME, MY ACCOUNT, PATIENTS' STATUS, PATIENTS' LOCATION, MONITORING DATA, LOGOUT, and the current timestamp (11:52:39 am). Below the navigation bar, the title 'PAIN SCORE DETAILS' is displayed. A sub-navigation bar shows HOSPITAL NO: 43, RECORD NO: 62, and PATIENT NAME: EUGENIO PICAZO. The main content area is titled 'PAIN SCORE' and contains a form with fields for Date and Time (set to 2007-10-26 10:00 AM) and Score (set to 5). There are 'save', 'reset', and 'cancel' buttons at the top right of the form. A link 'VIEW ALL SCORES' is located at the bottom right of the form area. At the very bottom of the page, a copyright notice reads 'Copyright © 2009, UP Manila. All Rights Reserved.'

Figure 47. Add/Edit Pain Score Details, POPMS

Managing of patient's medication pages are shown in Figures 48 – 50 while managing of patient's side effects are shown in Figures 51 – 53. Carried out medications cannot be edited.

Figure 54. Patient Details, POPMS

Copyright © 2008, UP Manila. All Rights Reserved.

When a user wishes to stop monitoring a patient, a pop-up notification, as shown in Figure 55, will be displayed warning the user about the consequences of stopping the monitoring.

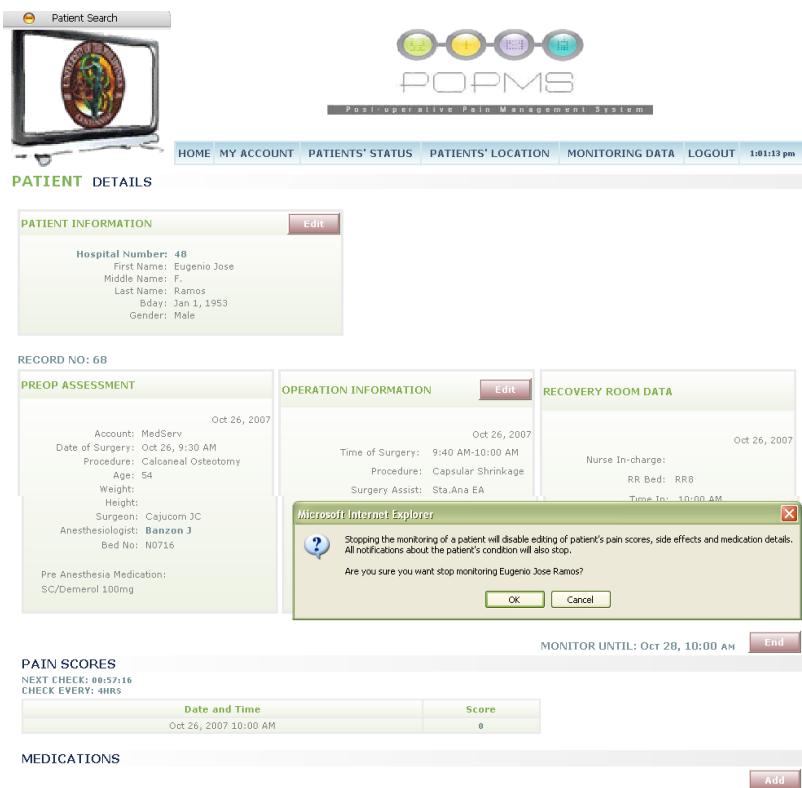

Figure 55. End Patient Monitoring, POPMS

Inpatients who already underwent monitoring are displayed in the Inpatients Not Under Monitoring List page, shown in Figure 56. The list can be sorted by patient name, bed number, surgical procedure, anesthesiologist name, surgeon name, anesthesia assistant name, surgical assistant name and OR date and time. The records displayed are limited to 25 records per page only. Clicking the discharge link will redirect the user to the Discharge Details page.

The screenshot shows the POPMS software interface. At the top, there is a logo for 'THE MEDICAL CITY' and the text 'Post-operative Pain Management System'. Below the logo is a navigation bar with links: HOME, MY ACCOUNT, PATIENTS' STATUS, PATIENTS' LOCATION, MONITORING DATA, LOGOUT, and the current time (1:12:41 pm). A sub-menu titled 'INPATIENTS NOT UNDER MONITORING' is displayed. The main content area shows a table of patient information:

Patient Name	Bed No.	Procedure	Anesthesia	Surgeon	Anesthesiologist Assistant	OR	Monitoring Ended	Action	
ORTIZA, Grace	N1415	Distal Ulnar Resection	GA/IV/Tracrium	Roxas MF	Banzon J	Catalan G	Oct 26 1:20 AM - 5:00 AM	Oct 28 11:46 PM	Discharge
DELA CRUZ, Christine Marie	N1012	ACL Reconstruction	Spinal/Marcaine	Salud JA	Catalan G	None	Oct 24 11:20 AM - 5:00 PM	Oct 26 10:00 AM	Discharge
ESQUERRA, Carlos	0601C	Blephoplasty	GA/Diprivan	Aleta KN	Catalan G	Vivar W	Oct 23 4:05 PM - 10:00 PM	Oct 25 10:00 PM	Discharge

At the bottom of the page, there are links for 'Patients 1-3 of 3 | Previous | Next' and a copyright notice: 'Copyright © 2008, UP Manila. All Rights Reserved.'

Figure 56. Inpatients Not Under Monitoring List, POPMS

Inpatients not under monitoring can be discharged by the doctors or nurses. Figure 57 shows the Discharge Patient page. After saving the discharge details, a message confirming discharge of patient will pop-up.

The screenshot shows the POPMS software interface. At the top, there is a logo for 'THE MEDICAL CITY' and the text 'Post-operative Pain Management System'. Below the logo is a navigation bar with links: HOME, MY ACCOUNT, PATIENT, MONITORING DATA, and LOGOUT. A sub-menu titled 'PATIENT DISCHARGE DETAILS' is displayed. The main content area shows a table of patient information:

HOSPITAL NO: 18	RECORD NO: 23	PATIENT NAME: CARLOS ESQUERRA
-----------------	---------------	-------------------------------

Below the table is a 'DISCHARGE DETAILS' form with fields: 'Ordered By:' (Aleta KN), 'Date Discharged:' (2007-10-26), and 'Time Discharged:' (01 : 25 PM). A confirmation dialog box is overlaid on the screen, asking 'Discharging a patient will disable editing of patient's consultation details. Do you want to continue discharging Carlos Esquerra?'. The dialog box has 'OK' and 'Cancel' buttons. At the bottom of the page, there is a copyright notice: 'Copyright © 2008, UP Manila. All Rights Reserved.'

Figure 57. Discharge Patient, POPMS

Figure 58 shows the doctors' view of patients' past records. The records can be sorted by patient name, record number, surgical procedure, OR date and time and date discharged. The records displayed are limited to 25 records per page only. Clicking the page name will redirect the user to the Patient Details page.

The screenshot shows the POPMS software interface. At the top, there's a logo for "THE MEDICAL CITY" and the text "Post-operative Pain Management System". Below the logo is a navigation bar with links: HOME, MY ACCOUNT, PATIENTS' STATUS, PATIENTS' LOCATION, MONITORING DATA, LOGOUT, and the current time (1:29:25 pm). A sub-menu bar below the main navigation bar includes PAST PATIENT RECORDS, PATIENTS' STATUS, PATIENTS' LOCATION, and MONITORING DATA. The main content area displays a table of past patient records with columns: Patient Name, Record No., Procedure, OR Date, Date Discharged, and Discharge Order. The table lists numerous patients with their corresponding details. At the bottom of the table, there are links for "Patients 1-25 of 41 Previous | Next".

Figure 58. List of Past Patient Records, POPMS

SMS messages window is only available for nurses. Nurses can only see text messages for patients assigned to them. A text message can be viewed by double clicking the message preview in the SMS Message window. A pop-up window will be displayed containing the full details of the patient as shown in Figure 59.

Figure 59. View Text Message, POPMS

The system administrator has the capability to manage users, nurse assignment schedules and hospital location. Administrators can manage the users of the system by going to the pages shown in Figures 60 – 62. The Users List Page gives the list of all the patient of the system. This list can be filtered by using the search options at the top of the page. The list can be sorted by user id, name, type cellphone number or status. The succeeding figures show the interface for adding, editing and deleting a user.

Figures 77 and 78 show the post operation report and RR report respectively. They are arranged to imitate the logbooks of residents and nurses. The reports can be delimited by selecting the start date and end date of the reports. When no date is provided, the system shows all the records in the database. The reports are also available in Microsoft Excel format as shown in Figures 79 and 80. Excel format can be viewed by clicking the Print to Excel format.

Date	Hospital No	Bed No	Patient Name	Age	Sex	MALASA	Account	Procedure Done	Surgeon	Surgical Assist	Anesthesiologist	Anesthesia Assist	Anesthesia Type	Anesthesia Agent	Anes Start	Anes End	OR Start	OR End

Figure 80. Recovery Room Report as Microsoft Excel Document, POPMS

Doctors who provided their cellular phone numbers will be able to receive and send SMS messages to and from the system. Figures 81 – 83 shows the sample text messages. Figure 81 shows the error messages that will be sent to a valid user once a wrong text format or a query problem occurred. Figure 82 displays the sample of a notification to a doctor when the system is triggered (refer to Figure 25. Flowchart for sending SMS messages, POPMS). Figure 83 shows the sample order message and the accompanying confirmation message automatically sent by the system.

POPMS: Sorry. Your message was not processed. The format is invalid. To send an order, text OR <MID><message> u:<username>p:<password> to this number . Ex: OR 1234 Diazepam 6mg every 4hrs u:cvbayot p:mypass123

POPMS: A problem occurred while processing your message. Please try again.

Figure 81. Error Messages, POPMS

POPMS: Eugene Picazo is experiencing a side effect (vomiting). Please reply to this message or edit the medication of the patient. To reply, text OR 42 <message> u:<username>p:<password>. Ex: OR 42 Diazepam 6mg every 4hrs u:cvbayot p:mypass123

POPMS: Eugene Picazo has a pain score of 5. Please reply to this message or edit the medication of the patient. To reply, text OR 42 <message> u:<username>p:<password>. Ex: OR 42 Diazepam 6mg every 4hrs u:cvbayot p:mypass123

Figure 82. SMS Notification to Doctor, POPMS

OR 1234 Diazepam 6mg every 4hrs u:cvbayot p:mypass123

POPMS: Your message was received by the system.

Figure 83. Order Message, POPMS

VI. DISCUSSION

The Post-operative Pain Management System with SMS is a web-based system that allows managing and storing of records of post-operative patients of TMC. It also enables nurses, residents and anesthesiologists of TMC to communicate via SMS. This is an advantage for the patients and medical practitioners in general because it avails the medical practitioners an easier way of storing and retrieving patient records helping them to focus on giving quality care to patients.

The system administrator manages the user accounts, locations in the hospital and nurse assignment schedules. User accounts that are maintained by the administrator include other system administrator, nurse, resident and anesthesiologist accounts. Initially, the system contains 138 rooms and 300 beds. The administrator can update the locations in order to match the current set up of the hospital. Nurse assignment schedules can also be updated to be consistent with the schedules provided by the hospital. The administrator can also view the post-operation and recovery room reports and print those reports in excel format.

POPMS entails access only to registered users of the system. Upon admittance of a patient, a nurse can add a new patient record or the pre-operation assessment of the patient. After the surgery, the RR nurse or the anesthesia assistant is allowed to input the operation data containing the operation procedures and medications. When the patient is transferred to the RR, the RR nurse or the anesthesia assistant is provided the capability to input the initial post-operative data of the patient. The RR nurse can clear the patient from the RR and transfer the patient to the unit. These functions are also available to the residents. Records of patients under monitoring can be updated by the nurses and doctors. Nurses can add and edit the pain scores, medications and side effects of the patients assigned to them. They can also add carried out medications. Residents and anesthesiologists can only update the medications of the patients. During the monitoring period, the nurses,

anesthesiologists, and residents can communicate via SMS. Doctors and nurses can end the monitoring of patients. After the monitoring period, the record of an inpatient can be viewed only by residents and assigned anesthesiologist. They are also the ones who can discharge the patient. When the patient is discharged, editing of the record of the patient will be disabled but it can be viewed by the residents or assigned anesthesiologist. Patient search function is provided to easily find a patient record. Patient records can be searched using the patient's hospital number and/or patient name.

In general, the system's capabilities can be summarized in the following manner: 1) provide a web interface for easily storing and retrieving of a post-operative patients' monitoring record, 2) provide reports about post-operation and recovery room details of patients, 3) allows a registered user to update records of the patients, 4) allows doctors to receive immediate notifications of their patients conditions and to send orders to nurses instantly.

VII. CONCLUSION

The Post-operative Pain Management System with SMS (POPMS) is a web-based system that allows managing and storing of records of post-operative patients of The Medical City and communication of medical practitioners and patients via SMS. The storage, retrieval and processing of data is more convenient and efficient using the system.

Electronic communication is an advantage for the hospital in general. It helps doctors to respond immediately to their patients' needs giving patients' satisfaction. The electronic registry of the post-operative patients allows easy monitoring of patients. The records of the patients' personal information, their operations, given interventions, effect of interventions and pain management, are accessed easily.

The reports of the resident's and nurse's RR logbooks can be viewed and printed to offer an alternative for their corresponding logbooks. The system allows faster and more efficient way of transmitting information that can help improve quality of care for patients.

VIII. RECOMMENDATION

POPMS only considers patients who underwent operation with anesthesia in the surgery suite of the 3rd floor of The Medical City. Though it caters service to most of the patients of the hospital, it would be better if all the patients will be considered by the system.

Also, only anesthetic concerns are considered by the system. It would more beneficial if all the concerns of the post-operative patient will be considered.

Lastly, charging of text messages is not considered by the system. It would be beneficial if the message charging will be included in the hospital bill so that load deficiency will not be a problem. This will also help so that doctors will not hesitate to use the system.

XI. ACKNOWLEDGEMENT

At long last I am here at the moment where I can finally write my acknowledgement. Through this, I would be able to express how much I overwhelmingly appreciate all the help, support and encouragement of the people around me.

First, I would like to thank Ate Eva Remulador's family and of course, my family for all the endless support. I dedicate this SP to you.

To Mr. Philip Zamora, thank you po. Although saglit ko lang kayong naging adviser, kayo po yung tumulong bumuo ng magawa ko ung first step in accomplishing my SP. To Mr. Geoffrey Solano, thank you very much for accepting me as your advisee with open arms?:D Thank you for all the effort and time you've spent in checking my SP and everything. To Sir JM Patino, thanks po sa pag-proxy kay Sir Solano nung final defense. To all the panels, thank you for being a very understanding panel and for all the suggestions. It's amazing you are able to understand how we understand our own SPs.

I also would like to express my sincere gratitude to Dr. Ethel Mendoza. For all the suggestions, for all the emails, for all the meetings and for all the text messages and calls. :D Sorry po sa pangungulit. Thank you for being so nice to me.

Sa lahat ng laging nagtatanong kung tapos na ang SP ko - relatives, RC friends, salamat sa pressure. Medyo natulungan ako.hehe

To my college friends and blockmates, acknowledgment available upon request.hahaha Meet na lang tayo para mapag-usapan. Special thanks to Richelle Argones. Salamat sa SMS function! Sorry hindi mahaba. Nagmamadali kasi. Bawi na lang ako sa ibang bagay.;p To Revilyn Malinao, salamat acknowledgement.hehehe

To my officemates, thanks for all the helpful and undeniably useful suggestions. To Ate Karen, salamat sa willingness na tulungan akong magawa ng SP kahit toxic. :p

To all those people whom I have not mentioned but had helped me in my SP in any way, please forgive me if I failed to include you here. Even so, thank you.

To God, your Love can never be paralleled. My very present help in time of need. I can remember, there were many times na I feel like I cant continue anymore, but honestly, during those moments, all I did was ask you to be with me, and you were there with me. You are an amazing God. I just cant thank you enough. I love you Lord. Tsup! :*
